Chapter 1

VectSharp: a light library for C# vector graphics

1.1 Introduction

VectSharp is a library to create vector graphics (including text) in C#, without too many dependencies.

VectSharp is written using .NET Core, and is available for Mac, Windows and Linux. Since version 2.0.0, it is released under an LGPLv3 license. It includes 14 standard fonts, originally released under an ASL-2.0 license.

It includes an abstract layer on top of which output layers can be written. Currently, there are five available output layers:

- **VectSharp.PDF** produces PDF documents.
- **VectSharp.Canvas** produces an `Avalonia.Controls.Canvas` object (https://avaloniaui.net/docs/controls/canvas) containing the rendered graphics objects.
- **VectSharp.SVG** produces vector graphics in SVG format.
- **VectSharp.Raster** produces raster images in PNG format, (this is done by rendering the image to a PDF document, and then using the `MuPDFCore` library to render the PDF). Since version 2.0.0, VectSharp.Raster is released under an AGPLv3 licence.
- **VectSharp.Raster.ImageSharp** produces raster images in multiple formats (BMP, GIF, JPEG, PBM, PNG, TGA, TIFF, WebP) using the `SixLabors.ImageSharp` library.

VectSharp.Raster and VectSharp.Raster.ImageSharp are somewhat overlapping, as both of them can be used to create PNG images. However, VectSharp.Raster is much faster, though it only supports the PNG format. Instead, VectSharp.Raster.ImageSharp is slower, but supports more formats and has a more permissive licence. Another difference is that VectSharp.Raster carries a native dependency (through MuPDFCore), while VectSharp.ImageSharp does not.

Furthermore:

- The **`VectSharp.Plots`** package contains classes and methods to draw plots (such as scatter plots, line charts, bar charts, box plots, function plots, and more).
- **`VectSharp.ThreeD`** adds support for 3D vector and raster graphics.

- **VectSharp.Markdown** can be used to transform Markdown documents into VectSharp objects, that can then be exported e.g. as PDF or SVG files, or displayed in an Avalonia `Canvas`. **VectSharp.MarkdownCanvas** uses VectSharp.Markdown to render Markdown documents in Avalonia applications (an example of this is in the `MarkdownViewerDemo project`).
- **VectSharp.MuPDFUtils**, released under an AGPLv3 licence, contains some utility functions that use `MuPDFCore` to make it possible to include in VectSharp graphics images in various formats.
- **VectSharp.ImageSharpUtils** adds the same capabilities as VectSharp.MuPDFUtils, using ImageSharp instead of MuPDFCore; as a result, it is released under a more permissive LGPLv3 licence.
- **VectSharp.Fonts.Nimbus** is a package released under a GPLv3 license, which contains the standard fonts that were used in VectSharp before version 2.0.0. Since these fonts are released under a GPL license, they had to be replaced when the VectSharp license changed to LGPL. See the [Font libraries](section) below for information on how to re-enable these fonts.
- The **Animation** class (provided in the base VectSharp package) can be used to create animations that can be saved as animated GIFs (using VectSharp.Raster.ImageSharp), SVGs (using VectSharp.SVG) and PNGs (using VectSharp.Raster or VectSharp.Raster.ImageSharp).

1.2 Installing VectSharp

To include VectSharp in your project, you will need one of the output layer NuGet packages: `VectSharp.PDF`, `VectSharp.Canvas`, `VectSharp.Raster`, `VectSharp.Raster.ImageSharp`, or `VectSharp.SVG`. You will need `VectSharp.ThreeD` to work with 3D graphics or `VectSharp.Plots` to create plots. You may want the `VectSharp.MuPDFUtils` package if you wish to manipulate raster images, and the `VectSharp.Fonts.Nimbus` if you want to restore the GPL-licensed fonts used in previous versions of the library.

1.3 Usage

You can find detailed documentation for the VectSharp library, **including interactive examples**, at the `documentation website`. A comprehensive API reference is also available, both as a `website` and as a `PDF manual`.

In general, working with VectSharp involves: creating a `Document`, adding `Page`s, drawing to the `Page`s' `Graphics` objects and, finally, exporting them to a PDF document, `Canvas`, PNG image or SVG document.

- Create a `Document`:
```
using VectSharp;
// ...
Document doc = new Document();
```
- Add a `Page`:
```
doc.Pages.Add(new Page(1000, 1000));
```
- Draw to the `Page`'s `Graphics` object:
```
Graphics gpr = doc.Pages.Last().Graphics;
gpr.FillRectangle(100, 100, 800, 800, Colour.FromRgb(128, 128, 128));
```
- Save as PDF document:
```
using VectSharp.PDF;
//...
doc.SaveAsPDF(@"Sample.pdf");
```
- Export the graphics to a `Canvas`:
```
using VectSharp.Canvas;
//...
Avalonia.Controls.Canvas can = doc.Pages.Last().PaintToCanvas();
```

- Export the graphics to a `Canvas`, using a multi-layer, multi-threaded, triple-buffered renderer based on SkiaSharp (which provides the best performance if you wish e.g. to place the canvas within a `Zoom↩Border`):
```
using VectSharp.Canvas;
//...
// A single page
Avalonia.Controls.Canvas can = doc.Pages.Last().PaintToSKCanvas();
// The whole document - each page will correspond to a layer
Avalonia.Controls.Canvas can = doc.PaintToSKCanvas();
```

- Save as a PNG image:
```
using VectSharp.Raster;
//...
doc.Pages.Last().SaveAsPNG(@"Sample.png");
```

- Save as a JPEG image:
```
using VectSharp.Raster.ImageSharp;
//...
doc.Pages.Last().SaveAsImage(@"Sample.jpg");
```

- Save as an SVG document:
```
using VectSharp.SVG;
//...
doc.Pages.Last().SaveAsSVG(@"Sample.svg");
```

- PDF and SVG documents support both internal and external links:
```
using VectSharp;
using VectSharp.PDF;
using VectSharp.SVG;
//...
Document document = new Document();
Page page = new Page(1000, 1000);
document.Pages.Add(page);
page.Graphics.FillRectangle(100, 100, 800, 50, Colour.FromRgb(128, 128, 128), tag:  "linkToGitHub");
page.Graphics.FillRectangle(100, 300, 800, 50, Colour.FromRgb(255, 0, 0), tag:
"linkToBlueRectangle");
page.Graphics.FillRectangle(100, 850, 800, 50, Colour.FromRgb(0, 0, 255), tag:  "blueRectangle");
Dictionary<string, string> links = new Dictionary<string, string>() { { "linkToGitHub",
"https://github.com/" }, { "linkToBlueRectangle", "#blueRectangle" } };
page.SaveAsSVG(@"Links.svg", linkDestinations:  links);
document.SaveAsPDF(@"Links.pdf", linkDestinations:  links);
```

  This code produces a document with three rectangles: the grey one at the top links to the GitHub home page, while the red one in the middle is a hyperlink to the blue one at the bottom. Links in PDF documents can refer to objects that are in a different page than the one containing the link.

The public classes and methods are `fully documented` (with interactive examples created using Blazor), and you can find a (much) more detailed code example in `MainWindow.xaml.cs`. A detailed guide about 3D graphics in VectSharp.ThreeD is available in the `VectSharp.ThreeD` folder. Further example code for animations is available in the `DemoAnimation project`.

1.4 Font libraries

Since version 2.0.0, font names are resolved using a "font library". This is a class that implements the `VectSharp.IFontLibrary` interface, providing methods to obtain a `FontFamily` object from a `string` or a `FontFamily.StandardFontFamilies` enumeration. The default font library included in VectSharp uses the embedded fonts (Arimo, Tinos, Cousine) as the standard font families.

In practice, assuming you want to use the default font library, you have the following options to create a `Font↩Family` object:
```
using VectSharp;
// ...
FontFamily helvetica = FontFamily.ResolveFontFamily(FontFamily.StandardFontFamilies.Helvetica); // Will
      resolve to the Arimo font family.
FontFamily times = FontFamily.ResolveFontFamily("Times-Roman"); // Will resolve to the Tinos font family.
```

These replace the `FontFamily(string)` and `FontFamily(StandardFontFamilies)` constructors of previous versions of VectSharp. Overloads of this method let you specify a list of "fallback" fonts that will be used if the first font you specify is not available.

If you wish, you can replace the default font library with a different one; this will change the way font families are resolved. For example, after installing the `VectSharp.Fonts.Nimbus` NuGet package, you can do:

```
using VectSharp;
// ...
FontFamily.DefaultFontLibrary = VectSharp.Fonts.Nimbus.Library;
FontFamily helvetica = FontFamily.ResolveFontFamily(FontFamily.StandardFontFamilies.Helvetica); // Will
      resolve to the Nimbus Sans L font family.
FontFamily times = FontFamily.ResolveFontFamily("Times-Roman"); // Will resolve to the Nimbus Roman No 9 L
      font family.
```

This will let you re-enable the fonts that were used in previous versions of VectSharp.

You can also use multiple font libraries in the same project. Again, assuming you have installed the VectSharp.Fonts.Nimbus NuGet package:

```
using VectSharp;
FontFamily helvetica1 = FontFamily.ResolveFontFamily(FontFamily.StandardFontFamilies.Helvetica); // Will
      resolve to the Arimo font family.
FontFamily times1 = FontFamily.ResolveFontFamily("Times-Roman"); // Will resolve to the Tinos font family.
FontFamily helvetica2 = VectSharp.Fonts.Nimbus.ResolveFontFamily(FontFamily.StandardFontFamilies.Helvetica);
      // Will resolve to the Nimbus Sans L font family.
FontFamily times2 = VectSharp.Fonts.Nimbus.ResolveFontFamily("Times-Roman"); // Will resolve to the Nimbus
      Roman No 9 L font family.
```

Finally, you can create your own font library class (which could implement things such as dowloading fonts from Google Fonts, or finding them in the user's system font directory...) by creating a class that implements the `IFont↩Library` interface or that extends the `FontLibrary` class (in this latter case, you get a default implementation for the `ResolveFontFamily` overloads that use a list of fallback fonts).

1.5 Creating new output layers

VectSharp can be easily extended to provide additional output layers. To do so:

1. Create a new class implementing the `IGraphicsContext` interface.
2. Provide an extension method to either the `Page` or `Document` types.
3. Somewhere in the extension method, call the `CopyToIGraphicsContext` method on the `Graphics` object of the `Page`s.
4. Opportunely save or return the rendered result.

1.6 Compiling VectSharp from source

The VectSharp source code includes an example project (*VectSharp.Demo*) presenting how VectSharp can be used to produce graphics.

To be able to compile VectSharp from source, you will need to install the latest `.NET SDK` for your operating system.

You can use `Microsoft Visual Studio` to compile the program. The following instructions will cover compiling VectSharp from the command line, instead.

First of all, you will need to download the VectSharp source code: `VectSharp.tar.gz` and extract it somewhere.

1.6.1 Windows

Open a command-line window in the folder where you have extracted the source code, and type:

```
BuildDemo <Target>
```

Where `<Target>` can be one of `Win-x64`, `Linux-x64` or `Mac-x64` depending on which platform you wish to generate executables for.

In the Release folder and in the appropriate subfolder for the target platform you selected, you will find the compiled program.

1.6.2 macOS and Linux

Open a terminal in the folder where you have extracted the source code, and type:

```
./BuildDemo.sh <Target>
```

Where `<Target>` can be one of `Win-x64`, `Linux-x64` or `Mac-x64` depending on which platform you wish to generate executables for.

In the Release folder and in the appropriate subfolder for the target platform you selected, you will find the compiled program.

If you receive an error about permissions being denied, try typing `chmod +x BuildDemo.sh` first.

1.7 Note about VectSharp.MuPDFUtils and .NET Framework

If you wish to use VectSharp.MuPDFUtils in a .NET Framework project, you will need to manually copy the native MuPDFWrapper library for the platform you are using to the executable directory (this is done automatically if you target .NET core).

One way to obtain the appropriate library files is:

1. Manually download the NuGet package for `MuPFDCore` (click on the "Download package" link on the right).
2. Rename the `.nupkg` file so that it has a `.zip` extension.
3. Extract the zip file.
4. Within the extracted folder, the library files are in the `runtimes/xxx-yyy/native/` folder, where `xxx` is either `linux`, `osx` or `win`, depending on the platform you are using, and `yyy` is `x64`, `x86` or `arm64` depending on the architecture.

Make sure you copy the appropriate file to the same folder as the executable!

Here is a list of all documented files with brief descriptions:

Chapter 6

Namespace Documentation

6.1 VectSharp Namespace Reference

Classes

- class AnimatedPNG

  Contains methods to create animated PNG image files.
- class Animation

  Describes an animation constituted by a number of frames and transitions between them.
- class Brush

  Represents a brush used to fill or stroke graphics elements. This could be a solid colour, or a more complicated gradient or pattern.
- struct Colour

  Represents an RGB colour.
- class Colours

  Standard colours.
- class DefaultFontLibrary

  A default font library that resolves standard families using the embedded fonts.
- class DisposableIntPtr

  An IDisposable wrapper around an IntPtr that frees the allocated memory when it is disposed.
- class Document

  Represents a collection of pages.
- class FolderFontLibrary

  A font library that resolves fonts from a folder containing TrueType files.
- class Font

  Represents a typeface with a specific size.
- class FontFamily

  Represents a typeface.
- class FontFamilyCreationException

  An exception that occurs while creating a FontFamily.
- class FontLibrary

  Abstract class with a default implementation of font family fallbacks.
- class FormattedText

  Represents a run of text that should be drawn with the same style.
- class FormattedTextExtensions

  Contains extension methods for collections of FormattedText objects.

- class Frame

  A key frame for an animation.
- class GradientBrush

  Represents a brush painting with a gradient.
- class Gradients

  Standard gradients.
- struct GradientStop

  Represents a colour stop in a gradient.
- class GradientStops

  Represents a read-only list of GradientStops.
- class Graphics

  Represents an abstract drawing surface.
- class GraphicsPath

  Represents a graphics path that can be filled or stroked.
- interface IEasing

  Describes a function used to transform the transition speed.
- interface IFontLibrary

  Represents a font library with methods to create FontFamily objects from a string or from FontFamily.StandardFontFamilies.
- interface IGraphicsContext

  This interface should be implemented by classes intended to provide graphics output capability to a Graphics object.
- class LinearEasing

  Describes a linear easing (i.e., no easing).
- class LinearGradientBrush

  Represents a brush painting with a linear gradient.
- struct LineDash

  Represents instructions on how to paint a dashed line.
- class MultiFontLibrary

  A font library that tries to resolve fonts using other font libraries.
- class Page

  Represents a Graphics object with a width and height.
- struct Point

  Represents a point relative to an origin in the top-left corner.
- class RadialGradientBrush

  Represents a brush painting with a radial gradient.
- class RasterImage

  Represents a raster image, created from raw pixel data. Consider using the derived classes included in the NuGet package "VectSharp.MuPDFUtils" if you need to load a raster image from a file or a Stream.
- struct Rectangle

  Represents a rectangle.
- class ResourceFontFamily

  Represents a FontFamily created from a resource stream.
- class Segment

  Represents a segment as part of a GraphicsPath.
- class SimpleFontLibrary

  A font library that can be used to cache and resolve font family names.
- struct Size

  Represents the size of an object.
- class SolidColourBrush

  Represents a brush painting with a single solid colour.
- class SplineEasing

  Describes an easing defined by a Cubic Bezier curve.

- class Transition

  Describes the transition between two successive Frames.
- class TrueTypeFile

  Represents a font file in TrueType format. Reference: http://stevehanov.ca/blog/?id=143, https://developer.apple.com/fonts/TrueType-Reference-Manual/, https://docs.microsoft.com/en-us/typography/opentype/spec/
- class UnbalancedStackException

  The exception that is thrown when an unbalanced graphics state stack occurs.

Enumerations

- enum TextBaselines

  Represent text baselines.
- enum TextAnchors

  Represents text anchors.
- enum LineCaps

  Represents line caps.
- enum LineJoins

  Represents line joining options.
- enum SegmentType

  Types of Segment.
- enum UnbalancedStackActions

  Represents ways to deal with unbalanced graphics state stacks.
- enum Script

  Represents the position of the text.
- enum FillRule

  Represents a rule used to determine whether a point is inside or outside of a shape.
- enum PixelFormats

  Represents the pixel format of a raster image.

6.1.1 Enumeration Type Documentation

6.1.1.1 FillRule

`enum VectSharp.FillRule`

Represents a rule used to determine whether a point is inside or outside of a shape.

Definition at line 262 of file Graphics.cs.

6.1.1.2 LineCaps

`enum VectSharp.LineCaps`

Represents line caps.

Definition at line 70 of file Enums.cs.

6.1.1.3 LineJoins

enum VectSharp.LineJoins

Represents line joining options.

Definition at line 91 of file Enums.cs.

6.1.1.4 PixelFormats

enum VectSharp.PixelFormats

Represents the pixel format of a raster image.

Definition at line 27 of file RasterImage.cs.

6.1.1.5 Script

enum VectSharp.Script

Represents the position of the text.

Definition at line 29 of file FormattedText.cs.

6.1.1.6 SegmentType

enum VectSharp.SegmentType

Types of Segment.

Definition at line 151 of file Enums.cs.

6.1.1.7 TextAnchors

enum VectSharp.TextAnchors

Represents text anchors.

Definition at line 49 of file Enums.cs.

6.1.1.8 TextBaselines

`enum VectSharp.TextBaselines`

Represent text baselines.

Definition at line 23 of file Enums.cs.

6.1.1.9 UnbalancedStackActions

`enum VectSharp.UnbalancedStackActions`

Represents ways to deal with unbalanced graphics state stacks.

Definition at line 182 of file Enums.cs.

6.2 VectSharp.Canvas Namespace Reference

Classes

- class AnimatedCanvas

  An Avalonia.Controls.Canvas containing an animation.
- class AvaloniaContextInterpreter

  Contains methods to render a Page to an Avalonia.Controls.Canvas.
- class FilterOption

  Determines how and whether image filters are rasterised.
- class RenderAction

  Represents a light-weight rendering action.
- class SKMultiLayerRenderCanvas

  Represents a multi-threaded, triple-buffered canvas on which the image is drawn using SkiaSharp.
- class SKRenderAction

  Represents a light-weight rendering action.
- class SKRenderContext

  Represents a page that has been prepared for fast rendering using the SkiaSharp renderer.
- class SKRenderContextInterpreter

  Contains methods to render a Page to an Avalonia.Controls.Canvas using the SkiaSharp renderer.

6.3 VectSharp.Filters Namespace Reference

Classes

- class BoxBlurFilter

  Represents a filter applying a box blur.
- class ColourMatrix

  Represents a colour transformation matrix.
- class ColourMatrixFilter

  Represents a filter that applies a Filters.ColourMatrix to the colours of the image.
- class CompositeLocationInvariantFilter

  Represents a filter that corresponds to applying multiple ILocationInvariantFilters one after the other.
- class ConvolutionFilter

  Represents a filter that applies a matrix convolution to the image.
- class FilterWithRasterisableParameter

  Represents a filter with a parameter that needs to be rasterised at the same resolution as the subject image prior to applying the filter.
- class GaussianBlurFilter

  Represents a filter that applies a Gaussian blur effect.
- interface IFilter

  Represents a filter. Do not implement this interface directly; instead, implement ILocationInvariantFilter or IFilterWithLocation.
- interface IFilterWithLocation

  Represents a filter whose results depend on the position of the subject image on the graphics surface.
- interface IFilterWithRasterisableParameter

  Represents a filter with a parameter that needs to be rasterised at the same resolution as the subject image prior to applying the filter. The FilterWithRasterisableParameter abstract class provides a default implementation of this interface.
- interface ILocationInvariantFilter

  Represents a filter that can be applied to an image regardless of its location on the graphics surface.
- class MaskFilter

  Represents a filter that uses the luminance of an image to mask another image.

6.4 VectSharp.Fonts Namespace Reference

Classes

- class Nimbus

  Contains an IFontLibrary providing access to the Nimbus family of standard fonts (used e.g. by MuPDF).

6.5 VectSharp.ImageSharpUtils Namespace Reference

Classes

- class ImageURIParser

  Provides a method to parse an image URI into a page.
- class RasterImageFile

  A RasterImage created from a file.
- class RasterImageStream

  A RasterImage created from a stream.

6.6 VectSharp.Markdown Namespace Reference

Classes

- struct FormattedString

  Represents a string with associated formatting information.
- class HTTPUtils

  Contains utilities to resolve absolute and relative URIs.
- class Margins

  Represents the margins of a page.
- class MarkdownRenderer

  Renders Markdown documents into VectSharp graphics objects.
- class SyntaxHighlighter

  Contains methods to perform syntax highlighting.

6.7 VectSharp.MarkdownCanvas Namespace Reference

Classes

- class MarkdownCanvasControl

  A control to display a Markdown document in an Avalonia application.

6.8 VectSharp.MuPDFUtils Namespace Reference

Classes

- class ImageURIParser

  Provides a method to parse an image URI into a page.
- class RasterImageFile

  A RasterImage created from a file.
- class RasterImageStream

  A RasterImage created from a stream.

6.9 VectSharp.PDF Namespace Reference

Classes

- class PDFContextInterpreter

  Contains methods to render a Document as a PDF document.

6.10 VectSharp.Plots Namespace Reference

Classes

- class ActionDataPointElement

  A symbol drawn by a custom Action.
- class Area

  A plot element that fills an area between a line passing through some data points and a base line.
- class Bars

  A plot element that draws bars.
- class BoxPlot

  A plot element that draws a box plot.
- class CategoricalBars

  A plot element that draws bars for categorical data.
- class CategoricalCoordinateSystem1D

  Represents a categorical 1-D coordinate system.
- class ClusteredBars

  A plot element that draws clusters of bars.
- class CompositeCoordinateSystem2D

  Combines two ICoordinateSystem1D<T>s to produce a ICoordinateSystem<T>.
- class ContinuousAxis

  A plot element that draws an axis line and an arrow.
- class ContinuousAxisLabels

  A plot element that draws equally spaced labels on an axis.
- class ContinuousAxisTicks

  A plot element that draws equally spaced ticks on an axis.
- class ContinuousAxisTitle

  A plot element that draws a title for an axis.
- class CoordinateSystem

  A coordinate system using a custom method to transform data points.
- class CoordinateSystem1D

  A coordinate system using a custom method to transform data points.
- class DataLabels

  A plot element that draws a text label at each data point.
- class DataLine

  A plot element that draws a line passing through a set of points.
- class ExponentialTrendLine

  A plot element that draws an exponential trendline with equation `y = b * Exp(a * x)`.
- class Function2D

  A plot element that plots a function of two variables.
- class Function2DGrid

  Represents a function of two variables that has been sampled in some points.
- class GraphicsDataPointElement

  A symbol defined by a VectSharp.Graphics object.
- class Grid

  A plot element that draws a grid.
- interface IContinuousCoordinateSystem

  Represents a coordinate system performing continuous transformations.
- interface IContinuousInvertibleCoordinateSystem

  Represents a coordinate system performing continuous invertible transformations.

- interface ICoordinateSystem

  Represents a coordinate system.
- interface ICoordinateSystem1D

  Represents a coordinate system tranforming data points of type T into `doubles`.
- interface IDataPointElement

  Represents a symbol that can be added to the plot at a specified position.
- interface IPlotElement

  Represents a plot element.
- class LinearCoordinateSystem1D

  Represents a 1-D linear coordinate system.
- class LinearCoordinateSystem2D

  Represents a linear coordinate system.
- class LinearTrendLine

  A plot element that draws a linear trendline with equation `y = a * x + b`.
- class LinLogCoordinateSystem2D

  Represents a semi-logarithmic coordinate system with a logarithmic transformation on the X axis.
- class LogarithmicCoordinateSystem1D

  Represents a 1-D logarithmic coordinate system.
- class LogarithmicCoordinateSystem2D

  Represents a logarithmic coordinate system.
- class LogarithmicTrendLine

  A plot element that draws a logarithmic trendline with equation `y = a * Ln(x) + b`.
- class LogLinCoordinateSystem2D

  Represents a semi-logarithmic coordinate system with a logarithmic transformation on the Y axis.
- class MovingAverageTrendLine

  A plot element that draws a moving average trendline.
- class PathDataPointElement

  A symbol defined by a GraphicsPath.
- class Pie

  A plot element that draws a pie or a doughnut.
- class Plot

  Represents a collection of plot elements.
- class PlotElement

  A plot element that uses an Action to draw its contents.
- class PlotElementPresentationAttributes

  Determines the appearance of plot elements.
- class PolynomialTrendLine

  A plot element that draws a polynomial trendline with equation `y = a0 + a1 * x + a2 * x^2 + ... + aN * x^N`.
- class PowerLawTrendLine

  A plot element that draws a power law trendline with equation `y = b * x^a`.
- class ScatterPoints

  A plot element that draws a symbol at the location of multiple data points.
- class StackedBars

  A plot element that draws stacked bars.
- class TextLabel

  A plot element that draws a single text label.
- class Violin

  A plot element that draws a violin plot.

6.11 VectSharp.Raster Namespace Reference

Classes

- class Raster

  Contains methods to render a page to a PNG image.

6.12 VectSharp.Raster.ImageSharp Namespace Reference

Classes

- class ImageSharpContextInterpreter

  Contains methods to render a Page to an Image.

Enumerations

- enum OutputFormats

  Enumeration containing the supported output formats.

6.12.1 Enumeration Type Documentation

6.12.1.1 OutputFormats

`enum VectSharp.Raster.ImageSharp.OutputFormats`

Enumeration containing the supported output formats.

Definition at line 1004 of file ImageSharpContext.cs.

6.13 VectSharp.SVG Namespace Reference

Classes

- class Parser

  Contains methods to read an SVG image file.
- class SVGContextInterpreter

  Contains methods to render a Page as an SVG file.

6.14 VectSharp.ThreeD Namespace Reference

Classes

- class AmbientLightSource

  Represents a uniform ambien light source.
- class AreaLightSource

  Represents a light source emitting light from a circular area.
- class ColourMaterial

  Represents a material that always has the same colour, regardless of light.
- interface ILightSource

  Represents a light source.
- interface IMaterial

  Represents a material used to the determine the appearance of Triangle3DElement.
- interface IScene

  Represents a 3D scene.
- struct LightIntensity

  Represents the intensity of a light source at a particular point.
- class MaskedLightSource

  Represents a point light source with a stencil in front of it.
- class ObjectFactory

  A static class containing methods to create complex 3D objects.
- class ParallelLightSource

  Represents a parallel light source.
- class PhongMaterial

  Represents a material that uses a Phong reflection model to determine the colour of the material based on the light sources that hit it.
- class PointLightSource

  Represents a point light source.
- class Scene

  Represents a 3D scene.
- class SpotlightLightSource

  Represents a conic spotlight.

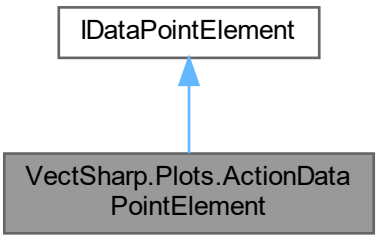
Chapter 7

Class Documentation

7.1 VectSharp.Plots.ActionDataPointElement Class Reference

A symbol drawn by a custom Action.

Inheritance diagram for VectSharp.Plots.ActionDataPointElement:



Public Member Functions

- void Plot (Graphics target, PlotElementPresentationAttributes presentationAttributes, string tag)

  Draw the symbol on the plot.

Parameters

target	*The Graphics object on which to draw. It is assumed that it has been transformed so that the symbol can be drawn centred at (0, 0)*
presentationAttributes	*Presentation attributes determining the appearance of the symbol.*
tag	*A tag to identify the symbol in the plot.*

- ActionDataPointElement (Action< Graphics, PlotElementPresentationAttributes, string > plotAction)

  Creates a new ActionDataPointElement using the specified action to draw the symbol.

Properties

- Action< Graphics, PlotElementPresentationAttributes, string > PlotAction `[get, set]`

  The Action used to draw the symbol. This should take as arguments the Graphics object on which to draw the symbol, the PlotElementPresentationAttributes describing the appearance of the symbol, and a `string` representing a tag for the symbol.

7.1.1 Detailed Description

A symbol drawn by a custom Action.

Definition at line 122 of file DataPoints.cs.

7.1.2 Constructor & Destructor Documentation

7.1.2.1 ActionDataPointElement()

```
VectSharp.Plots.ActionDataPointElement.ActionDataPointElement (
            Action< Graphics, PlotElementPresentationAttributes, string > plotAction )
```

Creates a new ActionDataPointElement using the specified action to draw the symbol.

Parameters

plotAction	The Action used to draw the symbol. This should take as arguments the Graphics object on which to draw the symbol, the PlotElementPresentationAttributes describing the appearance of the symbol, and a `string` representing a tag for the symbol.

Definition at line 140 of file DataPoints.cs.

7.1.3 Member Function Documentation

7.1.3.1 Plot()

```
void VectSharp.Plots.ActionDataPointElement.Plot (
            Graphics target,
            PlotElementPresentationAttributes presentationAttributes,
            string tag )
```

Draw the symbol on the plot.

Parameters

target	The Graphics object on which to draw. It is assumed that it has been transformed so that the symbol can be drawn centred at (0, 0)
presentationAttributes	Presentation attributes determining the appearance of the symbol.
tag	A tag to identify the symbol in the plot.

Implements VectSharp.Plots.IDataPointElement.

7.1.4 Property Documentation

7.1.4.1 PlotAction

```
Action<Graphics, PlotElementPresentationAttributes, string> VectSharp.Plots.ActionDataPoint↩
Element.PlotAction [get], [set]
```

The Action used to draw the symbol. This should take as arguments the Graphics object on which to draw the symbol, the PlotElementPresentationAttributes describing the appearance of the symbol, and a `string` representing a tag for the symbol.

Definition at line 129 of file DataPoints.cs.

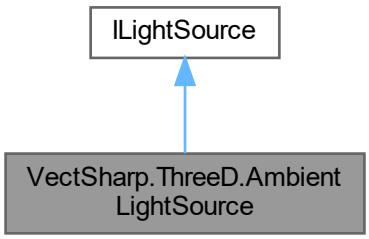
The documentation for this class was generated from the following file:

- VectSharp.Plots/DataPoints.cs

7.2 VectSharp.ThreeD.AmbientLightSource Class Reference

Represents a uniform ambien light source.

Inheritance diagram for VectSharp.ThreeD.AmbientLightSource:



Public Member Functions

- AmbientLightSource (double intensity)

  Creates a new AmbientLightSource instance.
- LightIntensity GetLightAt (Point3D point)

  Computes the light intensity at the specified point, without taking into account any obstructions.

Parameters

point	*The Point3DElement at which the light intensity should be computed.*

Returns

- double GetObstruction (Point3D point, IEnumerable< Triangle3DElement > shadowingTriangles)

  Determines the amount of obstruction of the light that results at point due to the specified shadowingTriangles .

Parameters

point	*The Point3D at which the obstruction should be computed.*
shadowingTriangles	*A collection of Triangle3DElement casting shadows.*

Returns

1 if the light is completely obstructed, 0 if the light is completely visible, a value between these if the light is partially obstructed.

Properties

- double Intensity `[get, set]`

  The intensity of the light.
- bool CastsShadow `[get]`

  Determines whether the light casts a shadow or not.

7.2.1 Detailed Description

Represents a uniform ambien light source.

Definition at line 91 of file Lights.cs.

7.2.2 Constructor & Destructor Documentation

7.2.2.1 AmbientLightSource()

```
VectSharp.ThreeD.AmbientLightSource.AmbientLightSource (
            double intensity )
```

Creates a new AmbientLightSource instance.

Parameters

intensity	The intensity of the light.

Definition at line 105 of file Lights.cs.

7.2.3 Member Function Documentation

7.2.3.1 GetLightAt()

```
LightIntensity VectSharp.ThreeD.AmbientLightSource.GetLightAt (
            Point3D point )
```

Computes the light intensity at the specified point, without taking into account any obstructions.

Parameters

point	The Point3DElement at which the light intensity should be computed.

Returns

Implements VectSharp.ThreeD.ILightSource.

Definition at line 111 of file Lights.cs.

7.2.3.2 GetObstruction()

```
double VectSharp.ThreeD.AmbientLightSource.GetObstruction (
            Point3D point,
            IEnumerable< Triangle3DElement > shadowingTriangles )
```

Determines the amount of obstruction of the light that results at *point* due to the specified *shadowingTriangles* .

Parameters

point	The Point3D at which the obstruction should be computed.
shadowingTriangles	A collection of Triangle3DElement casting shadows.

Returns

1 if the light is completely obstructed, 0 if the light is completely visible, a value between these if the light is partially obstructed.

Implements VectSharp.ThreeD.ILightSource.

Definition at line 117 of file Lights.cs.

7.2.4 Property Documentation

7.2.4.1 CastsShadow

```
bool VectSharp.ThreeD.AmbientLightSource.CastsShadow  [get]
```

Determines whether the light casts a shadow or not.

Implements VectSharp.ThreeD.ILightSource.

Definition at line 99 of file Lights.cs.

7.2.4.2 Intensity

```
double VectSharp.ThreeD.AmbientLightSource.Intensity  [get], [set]
```

The intensity of the light.

Definition at line 96 of file Lights.cs.

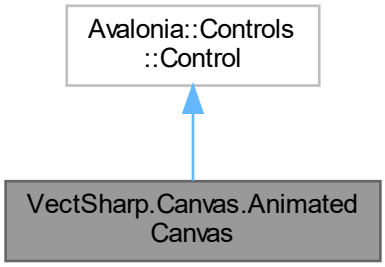
The documentation for this class was generated from the following file:

- VectSharp.ThreeD/Lights.cs

7.3 VectSharp.Canvas.AnimatedCanvas Class Reference

An Avalonia.Controls.Canvas containing an animation.

Inheritance diagram for VectSharp.Canvas.AnimatedCanvas:



Public Member Functions

- override void Render (DrawingContext context)

Static Public Attributes

- static readonly StyledProperty< int > CurrentFrameProperty

  Defines the CurrentFrame property.
- static readonly DirectProperty< AnimatedCanvas, int > FrameCountProperty = AvaloniaProperty.Register↩ Direct<AnimatedCanvas, int>(nameof(FrameCount), o => o.maxFrameIndex)

  Defines the FrameCount property.
- static readonly DirectProperty< AnimatedCanvas, double > FrameRateProperty = AvaloniaProperty.↩ RegisterDirect<AnimatedCanvas, double>(nameof(FrameRate), o => o.FrameRate)

  Defines the FrameRate property.
- static readonly StyledProperty< bool > IsPlayingProperty

  Defines the IsPlaying property.

Properties

- int CurrentFrame `[get, set]`

  The current frame in the animation.
- int FrameCount `[get]`

  The number of frames in the animation.
- double FrameRate `[get]`

  The target frame rate of the animation.
- bool IsPlaying `[get, set]`

  The current frame in the animation.

7.3.1 Detailed Description

An Avalonia.Controls.Canvas containing an animation.

Definition at line 28 of file AnimatedCanvas.cs.

7.3.2 Member Function Documentation

7.3.2.1 Render()

```
override void VectSharp.Canvas.AnimatedCanvas.Render (
            DrawingContext context )
```

Definition at line 203 of file AnimatedCanvas.cs.

7.3.3 Member Data Documentation

7.3.3.1 CurrentFrameProperty

```
readonly StyledProperty<int> VectSharp.Canvas.AnimatedCanvas.CurrentFrameProperty  [static]
```

Initial value:

```
= AvaloniaProperty.Register<AnimatedCanvas, int>(nameof(CurrentFrame), coerce:  (ownerObject, val) =>
        {
            AnimatedCanvas owner = (AnimatedCanvas)ownerObject;
            if (owner.maxFrameIndex > 0)
            {
                if (val < owner.maxFrameIndex)
                {
                    return val;
                }
                else
                {
                    owner.IsPlaying = false;
                    return owner.maxFrameIndex - 1;
                }
            }
            else
            {
                return val % owner.RenderActions.Length;
            }
        })
```

Defines the CurrentFrame property.

Definition at line 33 of file AnimatedCanvas.cs.

7.3.3.2 FrameCountProperty

```
readonly DirectProperty<AnimatedCanvas, int> VectSharp.Canvas.AnimatedCanvas.FrameCount↩
Property = AvaloniaProperty.RegisterDirect<AnimatedCanvas, int>(nameof(FrameCount), o => o.↩
maxFrameIndex)  [static]
```

Defines the FrameCount property.

Definition at line 67 of file AnimatedCanvas.cs.

7.3.3.3 FrameRateProperty

```
readonly DirectProperty<AnimatedCanvas, double> VectSharp.Canvas.AnimatedCanvas.FrameRate↩
Property = AvaloniaProperty.RegisterDirect<AnimatedCanvas, double>(nameof(FrameRate), o =>
o.FrameRate)  [static]
```

Defines the FrameRate property.

Definition at line 91 of file AnimatedCanvas.cs.

7.3.3.4 IsPlayingProperty

```
readonly StyledProperty<bool> VectSharp.Canvas.AnimatedCanvas.IsPlayingProperty  [static]
```

Initial value:

```
= AvaloniaProperty.Register<AnimatedCanvas, bool>(nameof(IsPlaying), false, coerce:  (ownerObject, val) =>
        {
            AnimatedCanvas owner = (AnimatedCanvas)ownerObject;
            if (owner.IsPlaying && !val)
            {
                owner.RefreshTimer.Dispose();
            }
            else if (!owner.IsPlaying && val)
            {
                owner.RefreshTimer = new System.Threading.Timer(_ =>
                {
                    _ = Avalonia.Threading.Dispatcher.UIThread.InvokeAsync(() =>
                    {
                        owner.CurrentFrame++;
                    });
                }, null, 0, (long)(1000.0 / owner.FrameRate));
            }
            return val;
        })
```

Defines the IsPlaying property.

Definition at line 115 of file AnimatedCanvas.cs.

7.3.4 Property Documentation

7.3.4.1 CurrentFrame

```
int VectSharp.Canvas.AnimatedCanvas.CurrentFrame  [get], [set]
```

The current frame in the animation.

Definition at line 58 of file AnimatedCanvas.cs.

7.3.4.2 FrameCount

```
int VectSharp.Canvas.AnimatedCanvas.FrameCount  [get]
```

The number of frames in the animation.

Definition at line 74 of file AnimatedCanvas.cs.

7.3.4.3 FrameRate

```
double VectSharp.Canvas.AnimatedCanvas.FrameRate  [get]
```

The target frame rate of the animation.

Definition at line 98 of file AnimatedCanvas.cs.

7.3.4.4 IsPlaying

```
bool VectSharp.Canvas.AnimatedCanvas.IsPlaying  [get], [set]
```

The current frame in the animation.

Definition at line 140 of file AnimatedCanvas.cs.

The documentation for this class was generated from the following file:

- VectSharp.Canvas/AnimatedCanvas.cs

7.4 VectSharp.AnimatedPNG Class Reference

Contains methods to create animated PNG image files.

Classes

- class CompressedFrame

  Represents an individual frame of a PNG animation.

Public Types

- enum InterframeCompression

  Types of inter-frame compression.

Static Public Member Functions

- static unsafe void Create (Stream outputStream, int width, int height, bool hasAlpha, IReadOnlyList< CompressedFrame > compressedFrames, int repeatCount)

  Create a new animated PNG image, outputting it to the specified stream.

7.4.1 Detailed Description

Contains methods to create animated PNG image files.

Definition at line 30 of file ImageFormats.cs.

7.4.2 Member Enumeration Documentation

7.4.2.1 InterframeCompression

```
enum VectSharp.AnimatedPNG.InterframeCompression
```

Types of inter-frame compression.

Definition at line 35 of file ImageFormats.cs.

7.4.3 Member Function Documentation

7.4.3.1 Create()

```
static unsafe void VectSharp.AnimatedPNG.Create (
            Stream outputStream,
            int width,
            int height,
            bool hasAlpha,
            IReadOnlyList< CompressedFrame > compressedFrames,
            int repeatCount )  [static]
```

Create a new animated PNG image, outputting it to the specified stream.

Parameters

outputStream	The stream to which the animated PNG image will be written.
width	The width of the image in pixels.
height	The height of the image in pixels.
hasAlpha	If the frames of the image have an alpha channel, set this to `true`; otherwise, set it to `false`.
compressedFrames	The frames that will be used to create the animated PNG image.
repeatCount	The number of times that the animation should loop. Set this to 0 for an infinitely repeating animation.

Definition at line 181 of file ImageFormats.cs.

The documentation for this class was generated from the following file:

- VectSharp/ImageFormats.cs

7.5 VectSharp.Animation Class Reference

Describes an animation constituted by a number of frames and transitions between them.

Public Member Functions

- Animation (double width, double height, double linearisationResolution)

  Creates a new Animation with the specified width, height and linearisation resolution.
- Page GetFrameAtAbsolute (double time)

  Obtains the (interpolated) frame that should be displayed after the specified time has passed since the start of the animation.
- Page GetFrameAtRelative (double relativeTime)

  Obtains the (interpolated) frame that should be displayed after the specified relative time has passed since the start of the animation.
- void AddFrame (Frame frame, Transition transition=null)

  Adds a new frame to the animation, with the specified transition.
- void RemoveLastFrame ()

  Removes the last frame from the animation (and the corresponding transition).

Properties

- ImmutableList< Frame > Frames = ImmutableList<Frame>.Empty `[get]`

  The key frames of the animation.
- ImmutableList< Transition > Transitions = ImmutableList<Transition>.Empty `[get]`

  The transitions between successive frames of the animation. This array always contains one fewer element than Frames.
- double Width `[get, set]`

  The width of the animation.
- double Height `[get, set]`

  The height of the animation.
- Colour Background = Colour.FromRgba(255, 255, 255, 0) `[get, set]`

  The background colour of the animation.
- double LinearisationResolution `[get]`

  The absolute length between successive samples to use when linearising GraphicsPaths.
- double Duration = 0 `[get]`

  The total duration of the animation (not including the number of repeats).
- int RepeatCount = 0 `[get, set]`

  The number of times that the animation should repeat.

7.5.1 Detailed Description

Describes an animation constituted by a number of frames and transitions between them.

Definition at line 1380 of file Animation.cs.

7.5.2 Constructor & Destructor Documentation

7.5.2.1 Animation()

```
VectSharp.Animation.Animation (
            double width,
            double height,
            double linearisationResolution )
```

Creates a new Animation with the specified width, height and linearisation resolution.

Parameters

width	The width of the animation.
height	The height of the animation.
linearisationResolution	The absolute length between successive samples to use when linearising GraphicsPaths.

Definition at line 1431 of file Animation.cs.

7.5.3 Member Function Documentation

7.5.3.1 AddFrame()

```
void VectSharp.Animation.AddFrame (
            Frame frame,
            Transition transition = null )
```

Adds a new frame to the animation, with the specified transition.

Parameters

frame	The new frame to add to the animation.
transition	The transition that should be applied between the previous frame and the new frame. This parameter is ignored for the first frame. If this is `null`, the animation will abruptly change from one frame to the next.

Definition at line 1556 of file Animation.cs.

7.5.3.2 GetFrameAtAbsolute()

```
Page VectSharp.Animation.GetFrameAtAbsolute (
            double time )
```

Obtains the (interpolated) frame that should be displayed after the specified time has passed since the start of the animation.

Parameters

time	The time since the start of the animation (in milliseconds).

Returns

A Page containing the interpolated frame that should be displayed after the specified time has passed since the start of the animation.

Definition at line 1443 of file Animation.cs.

7.5.3.3 GetFrameAtRelative()

```
Page VectSharp.Animation.GetFrameAtRelative (
            double relativeTime )
```

Obtains the (interpolated) frame that should be displayed after the specified relative time has passed since the start of the animation.

Parameters

relativeTime	The time since the start of the animation (ranging from 0 for the start of the animation, to 1 for the end of the animation).

Returns

A Page containing the interpolated frame that should be displayed after the specified time has passed since the start of the animation.

Definition at line 1546 of file Animation.cs.

7.5.3.4 RemoveLastFrame()

```
void VectSharp.Animation.RemoveLastFrame ( )
```

Removes the last frame from the animation (and the corresponding transition).

Exceptions

ArgumentOutOfRangeException	Thrown if there are no frames in the animation.

Definition at line 1578 of file Animation.cs.

7.5.4 Property Documentation

7.5.4.1 Background

```
Colour VectSharp.Animation.Background = Colour.FromRgba(255, 255, 255, 0)  [get], [set]
```

The background colour of the animation.

Definition at line 1408 of file Animation.cs.

7.5.4.2 Duration

```
double VectSharp.Animation.Duration = 0  [get]
```

The total duration of the animation (not including the number of repeats).

Definition at line 1418 of file Animation.cs.

7.5.4.3 Frames

```
ImmutableList<Frame> VectSharp.Animation.Frames = ImmutableList<Frame>.Empty  [get]
```

The key frames of the animation.

Definition at line 1385 of file Animation.cs.

7.5.4.4 Height

```
double VectSharp.Animation.Height  [get], [set]
```

The height of the animation.

Definition at line 1403 of file Animation.cs.

7.5.4.5 LinearisationResolution

```
double VectSharp.Animation.LinearisationResolution  [get]
```

The absolute length between successive samples to use when linearising GraphicsPaths.

Definition at line 1413 of file Animation.cs.

7.5.4.6 RepeatCount

```
int VectSharp.Animation.RepeatCount = 0  [get], [set]
```

The number of times that the animation should repeat.

Definition at line 1423 of file Animation.cs.

7.5.4.7 Transitions

```
ImmutableList<Transition> VectSharp.Animation.Transitions = ImmutableList<Transition>.Empty
[get]
```

The transitions between successive frames of the animation. This array always contains one fewer element than Frames.

Definition at line 1390 of file Animation.cs.

7.5.4.8 Width

```
double VectSharp.Animation.Width  [get], [set]
```

The width of the animation.

Definition at line 1398 of file Animation.cs.

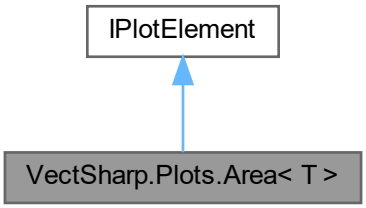
The documentation for this class was generated from the following file:

- VectSharp/Animation.cs

7.6 VectSharp.Plots.Area< T > Class Template Reference

A plot element that fills an area between a line passing through some data points and a base line.

Inheritance diagram for VectSharp.Plots.Area< T >:



Public Member Functions

- Area (IEnumerable< T > data, Func< T, T > getBaseline, ICoordinateSystem< T > coordinateSystem)
  Create a new Area< T > instance.
- void Plot (Graphics target)
  Draw the plot element on the specified target Graphics.

Parameters

target	*The Graphics on which to draw.*

Properties

- IEnumerable< T > Data `[get, set]`

  The data points through which the upper part of the area will pass.
- Func< T, T > GetBaseline `[get, set]`

  A function returning the baseline for each data point.
- bool Smooth `[get, set]`

  If this is `false`, straight line segments are used to join the data points. If this is `true`, a smooth spline passing through all of them is used instead.
- ICoordinateSystem< T > CoordinateSystem `[get, set]`

  The coordinate system used to transform the points from data space to plot space.
- PlotElementPresentationAttributes PresentationAttributes = new PlotElementPresentationAttributes() `[get, set]`

  Presentation attributes determining the appearance of the area.
- string Tag `[get, set]`

  A tag to identify the area in the plot.

7.6.1 Detailed Description

A plot element that fills an area between a line passing through some data points and a base line.

Template Parameters

T	The kind of data describing the data points (generally, `IReadOnlyList<double>`).

Definition at line 599 of file DataPoints.cs.

7.6.2 Constructor & Destructor Documentation

7.6.2.1 Area()

```
VectSharp.Plots.Area< T >.Area (
            IEnumerable< T > data,
            Func< T, T > getBaseline,
            ICoordinateSystem< T > coordinateSystem )
```

Create a new Area<T> instance.

Parameters

data	The data points through which the upper part of the area will pass.
getBaseline	A function returning the baseline for each data point.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 640 of file DataPoints.cs.

7.6.3 Member Function Documentation

7.6.3.1 Plot()

```
void VectSharp.Plots.Area< T >.Plot (
            Graphics target )
```

Draw the plot element on the specified *target* Graphics.

Parameters

target	The Graphics on which to draw.

Implements VectSharp.Plots.IPlotElement.

Definition at line 648 of file DataPoints.cs.

7.6.4 Property Documentation

7.6.4.1 CoordinateSystem

```
ICoordinateSystem<T> VectSharp.Plots.Area< T >.CoordinateSystem  [get], [set]
```

The coordinate system used to transform the points from data space to plot space.

Implements VectSharp.Plots.IPlotElement.

Definition at line 621 of file DataPoints.cs.

7.6.4.2 Data

```
IEnumerable<T> VectSharp.Plots.Area< T >.Data  [get], [set]
```

The data points through which the upper part of the area will pass.

Definition at line 604 of file DataPoints.cs.

7.6.4.3 GetBaseline

```
Func<T, T> VectSharp.Plots.Area< T >.GetBaseline  [get], [set]
```

A function returning the baseline for each data point.

Definition at line 609 of file DataPoints.cs.

7.6.4.4 PresentationAttributes

```
PlotElementPresentationAttributes VectSharp.Plots.Area< T >.PresentationAttributes = new
PlotElementPresentationAttributes()  [get], [set]
```

Presentation attributes determining the appearance of the area.

Definition at line 627 of file DataPoints.cs.

7.6.4.5 Smooth

```
bool VectSharp.Plots.Area< T >.Smooth  [get], [set]
```

If this is `false`, straight line segments are used to join the data points. If this is `true`, a smooth spline passing through all of them is used instead.

Definition at line 615 of file DataPoints.cs.

7.6.4.6 Tag

```
string VectSharp.Plots.Area< T >.Tag  [get], [set]
```

A tag to identify the area in the plot.

Definition at line 632 of file DataPoints.cs.

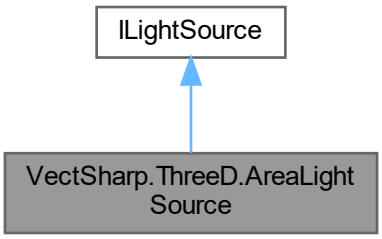
The documentation for this class was generated from the following file:

- VectSharp.Plots/DataPoints.cs

7.7 VectSharp.ThreeD.AreaLightSource Class Reference

Represents a light source emitting light from a circular area.

Inheritance diagram for VectSharp.ThreeD.AreaLightSource:



Public Member Functions

- AreaLightSource (double intensity, Point3D center, double radius, double penumbraRadius, Normalized↩ Vector3D direction, double sourceDistance, int shadowSamplingPointCount)

  Creates a new AreaLightSource instance.
- LightIntensity GetLightAt (Point3D point)

  Computes the light intensity at the specified point, without taking into account any obstructions.

Parameters

point	*The Point3DElement at which the light intensity should be computed.*

Returns

- double GetObstruction (Point3D point, IEnumerable< Triangle3DElement > shadowingTriangles)

  Determines the amount of obstruction of the light that results at point due to the specified shadowingTriangles .

Parameters

point	*The Point3D at which the obstruction should be computed.*
shadowingTriangles	*A collection of Triangle3DElement casting shadows.*

Returns

1 if the light is completely obstructed, 0 if the light is completely visible, a value between these if the light is partially obstructed.

Properties

- bool CastsShadow = true `[get, set]`

  Determines whether the light casts a shadow or not.
- Point3D Center `[get]`

The centre of the light-emitting area.

- NormalizedVector3D Direction `[get]`

  The direction of the light's main axis, i.e. the normal to the plane containing the light-emitting area.

- double Radius `[get]`

  The radius of the light emitting area.

- double PenumbraRadius `[get]`

  The radius of the penumbra area.

- double Intensity `[get, set]`

  The base intensity of the light.

- double SourceDistance `[get]`

  The distance between the focal point of the light and the light's Center.

- double DistanceAttenuationExponent = 2 `[get, set]`

  An exponent determining how fast the light attenuates with increasing distance. Set to 0 to disable distance attenuation.

- double PenumbraAttenuationExponent = 1 `[get, set]`

  An exponent determining how fast the light attenuates between the light-emitting area radius and the penumbra radius.

- int ShadowSamplingPointCount `[get]`

  The number of points to use when determining the amount of light that is obstructed at a certain point.

7.7.1 Detailed Description

Represents a light source emitting light from a circular area.

Definition at line 579 of file Lights.cs.

7.7.2 Constructor & Destructor Documentation

7.7.2.1 AreaLightSource()

```
VectSharp.ThreeD.AreaLightSource.AreaLightSource (
            double intensity,
            Point3D center,
            double radius,
            double penumbraRadius,
            NormalizedVector3D direction,
            double sourceDistance,
            int shadowSamplingPointCount )
```

Creates a new AreaLightSource instance.

Parameters

intensity	The base intensity of the light.
center	The centre of the light-emitting area.
radius	The radius of the light-emitting area.
penumbraRadius	The radius of the penumbra area.
direction	The direction of the light.
sourceDistance	The distance between the focal point of the light and the light's center.
shadowSamplingPointCount	The number of points to use when determining the amount of light that is obstructed at a certain point.

Definition at line 643 of file Lights.cs.

7.7.3 Member Function Documentation

7.7.3.1 GetLightAt()

```
LightIntensity VectSharp.ThreeD.AreaLightSource.GetLightAt (
            Point3D point )
```

Computes the light intensity at the specified point, without taking into account any obstructions.

Parameters

point	The Point3DElement at which the light intensity should be computed.

Returns

Implements VectSharp.ThreeD.ILightSource.

Definition at line 690 of file Lights.cs.

7.7.3.2 GetObstruction()

```
double VectSharp.ThreeD.AreaLightSource.GetObstruction (
            Point3D point,
            IEnumerable< Triangle3DElement > shadowingTriangles )
```

Determines the amount of obstruction of the light that results at *point* due to the specified *shadowingTriangles* .

Parameters

point	The Point3D at which the obstruction should be computed.
shadowingTriangles	A collection of Triangle3DElement casting shadows.

Returns

1 if the light is completely obstructed, 0 if the light is completely visible, a value between these if the light is partially obstructed.

Implements VectSharp.ThreeD.ILightSource.

Definition at line 763 of file Lights.cs.

7.7.4 Property Documentation

7.7.4.1 CastsShadow

```
bool VectSharp.ThreeD.AreaLightSource.CastsShadow = true  [get], [set]
```

Determines whether the light casts a shadow or not.

Implements VectSharp.ThreeD.ILightSource.

Definition at line 582 of file Lights.cs.

7.7.4.2 Center

```
Point3D VectSharp.ThreeD.AreaLightSource.Center  [get]
```

The centre of the light-emitting area.

Definition at line 587 of file Lights.cs.

7.7.4.3 Direction

```
NormalizedVector3D VectSharp.ThreeD.AreaLightSource.Direction  [get]
```

The direction of the light's main axis, i.e. the normal to the plane containing the light-emitting area.

Definition at line 594 of file Lights.cs.

7.7.4.4 DistanceAttenuationExponent

```
double VectSharp.ThreeD.AreaLightSource.DistanceAttenuationExponent = 2  [get], [set]
```

An exponent determining how fast the light attenuates with increasing distance. Set to 0 to disable distance attenuation.

Definition at line 619 of file Lights.cs.

7.7.4.5 Intensity

```
double VectSharp.ThreeD.AreaLightSource.Intensity  [get], [set]
```

The base intensity of the light.

Definition at line 609 of file Lights.cs.

7.7.4.6 PenumbraAttenuationExponent

```
double VectSharp.ThreeD.AreaLightSource.PenumbraAttenuationExponent = 1  [get], [set]
```

An exponent determining how fast the light attenuates between the light-emitting area radius and the penumbra radius.

Definition at line 624 of file Lights.cs.

7.7.4.7 PenumbraRadius

```
double VectSharp.ThreeD.AreaLightSource.PenumbraRadius  [get]
```

The radius of the penumbra area.

Definition at line 604 of file Lights.cs.

7.7.4.8 Radius

```
double VectSharp.ThreeD.AreaLightSource.Radius  [get]
```

The radius of the light emitting area.

Definition at line 599 of file Lights.cs.

7.7.4.9 ShadowSamplingPointCount

```
int VectSharp.ThreeD.AreaLightSource.ShadowSamplingPointCount  [get]
```

The number of points to use when determining the amount of light that is obstructed at a certain point.

Definition at line 629 of file Lights.cs.

7.7.4.10 SourceDistance

```
double VectSharp.ThreeD.AreaLightSource.SourceDistance  [get]
```

The distance between the focal point of the light and the light's Center.

Definition at line 614 of file Lights.cs.

The documentation for this class was generated from the following file:

- VectSharp.ThreeD/Lights.cs

7.8 VectSharp.Canvas.AvaloniaContextInterpreter Class Reference

Contains methods to render a Page to an Avalonia.Controls.Canvas.

Public Types

- enum TextOptions

  Defines whether text items should be converted into paths when drawing.

Static Public Member Functions

- static Avalonia.Controls.Canvas PaintToCanvas (this Page page, TextOptions textOption=TextOptions.↩ ConvertIfNecessary, FilterOption filterOption=default)

  Render a Page to an Avalonia.Controls.Canvas.
- static Avalonia.Controls.Control PaintToCanvas (this Page page, bool graphicsAsControls, TextOptions text↩ Option=TextOptions.ConvertIfNecessary, FilterOption filterOption=default)

  Render a Page to an Avalonia.Controls.Control.
- static Avalonia.Controls.Control PaintToCanvas (this Page page, bool graphicsAsControls, Dictionary< string, Delegate > taggedActions, bool removeTaggedActionsAfterExecution=true, TextOptions textOption=Text↩ Options.ConvertIfNecessary, FilterOption filterOption=default)

  Render a Page to an Avalonia.Controls.Control.
- static Avalonia.Controls.Canvas PaintToCanvas (this Page page, Dictionary< string, Delegate > tagged↩ Actions, bool removeTaggedActionsAfterExecution=true, TextOptions textOption=TextOptions.ConvertIf↩ Necessary, FilterOption filterOption=default)

  Render a Page to an Avalonia.Controls.Control.
- static AnimatedCanvas PaintToAnimatedCanvas (this Animation animation, double frameRate=60, dou- ble durationScaling=1, TextOptions textOption=TextOptions.ConvertIfNecessary, FilterOption filter↩ Option=default)

  Render an Animation to an Avalonia.Controls.Control.

7.8.1 Detailed Description

Contains methods to render a Page to an Avalonia.Controls.Canvas.

Definition at line 2605 of file AvaloniaContext.cs.

7.8.2 Member Enumeration Documentation

7.8.2.1 TextOptions

```
enum VectSharp.Canvas.AvaloniaContextInterpreter.TextOptions
```

Defines whether text items should be converted into paths when drawing.

Definition at line 2610 of file AvaloniaContext.cs.

7.8.3 Member Function Documentation

7.8.3.1 PaintToAnimatedCanvas()

```
static AnimatedCanvas VectSharp.Canvas.AvaloniaContextInterpreter.PaintToAnimatedCanvas (
            this Animation animation,
            double frameRate = 60,
            double durationScaling = 1,
            TextOptions textOption = TextOptions.ConvertIfNecessary,
            FilterOption filterOption = default )  [static]
```

Render an Animation to an Avalonia.Controls.Control.

Parameters

animation	The Animation to render.
frameRate	The target frame rate of the animation, in frames-per-second (fps).
durationScaling	A scaling factor that will be applied to all durations in the animation. Values greater than 1 slow down the animation, values smaller than 1 accelerate it. Note that this does not affect the frame rate of the animation.
textOption	Defines whether text items should be converted into paths when drawing.
filterOption	Defines how and whether image filters should be rasterised when rendering the image.

Returns

An Avalonia.Controls.Control containing the rendered animation.

Definition at line 2728 of file AvaloniaContext.cs.

7.8.3.2 PaintToCanvas() [1/4]

```
static Avalonia.Controls.Control VectSharp.Canvas.AvaloniaContextInterpreter.PaintToCanvas (
            this Page page,
```

```
            bool graphicsAsControls,
            Dictionary< string, Delegate > taggedActions,
            bool removeTaggedActionsAfterExecution = true,
            TextOptions textOption = TextOptions.ConvertIfNecessary,
            FilterOption filterOption = default )  [static]
```

Render a Page to an Avalonia.Controls.Control.

Parameters

page	The Page to render.
graphicsAsControls	If this is true, each graphics object (e.g. paths, text...) is rendered as a separate Avalonia.Controls.Control. Otherwise, they are directly rendered onto the drawing context (which is faster, but does not allow interactivity).
taggedActions	A Dictionary<String, Delegate> containing the Actions that will be performed on items with the corresponding tag. If *graphicsAsControls* is true, the delegates should be voids that accept one parameter of type TextBlock or Path (depending on the tagged item), otherwise, they should accept one parameter of type RenderAction and return an IEnumerable<RenderAction> of the actions that will actually be performed.
removeTaggedActionsAfterExecution	Whether the Actions should be removed from *taggedActions* after their execution. Set to false if the same Action should be performed on multiple items with the same tag.
textOption	Defines whether text items should be converted into paths when drawing.
filterOption	Defines how and whether image filters should be rasterised when rendering the image.

Returns

An Avalonia.Controls.Control containing the rendered graphics objects.

Definition at line 2680 of file AvaloniaContext.cs.

7.8.3.3 PaintToCanvas() [2/4]

```
static Avalonia.Controls.Control VectSharp.Canvas.AvaloniaContextInterpreter.PaintToCanvas (
            this Page page,
            bool graphicsAsControls,
            TextOptions textOption = TextOptions.ConvertIfNecessary,
            FilterOption filterOption = default )  [static]
```

Render a Page to an Avalonia.Controls.Control.

Parameters

page	The Page to render.
graphicsAsControls	If this is true, each graphics object (e.g. paths, text...) is rendered as a separate Avalonia.Controls.Control. Otherwise, they are directly rendered onto the drawing context (which is faster, but does not allow interactivity).
textOption	Defines whether text items should be converted into paths when drawing.
filterOption	Defines how and whether image filters should be rasterised when rendering the image.

Returns

An Avalonia.Controls.Control containing the rendered graphics objects.

Definition at line 2653 of file AvaloniaContext.cs.

7.8.3.4 PaintToCanvas() [3/4]

```
static Avalonia.Controls.Canvas VectSharp.Canvas.AvaloniaContextInterpreter.PaintToCanvas (
            this Page page,
            Dictionary< string, Delegate > taggedActions,
            bool removeTaggedActionsAfterExecution = true,
            TextOptions textOption = TextOptions.ConvertIfNecessary,
            FilterOption filterOption = default )  [static]
```

Render a Page to an Avalonia.Controls.Control.

Parameters

page	The Page to render.
taggedActions	A Dictionary<String, Delegate> containing the Actions that will be performed on items with the corresponding tag. The delegates should accept one parameter of type TextBlock or Path (depending on the tagged item).
removeTaggedActionsAfterExecution	Whether the Actions should be removed from *taggedActions* after their execution. Set to false if the same Action should be performed on multiple items with the same tag.
textOption	Defines whether text items should be converted into paths when drawing.
filterOption	Defines how and whether image filters should be rasterised when rendering the image.

Returns

An Avalonia.Controls.Control containing the rendered graphics objects.

Definition at line 2706 of file AvaloniaContext.cs.

7.8.3.5 PaintToCanvas() [4/4]

```
static Avalonia.Controls.Canvas VectSharp.Canvas.AvaloniaContextInterpreter.PaintToCanvas (
            this Page page,
            TextOptions textOption = TextOptions.ConvertIfNecessary,
            FilterOption filterOption = default )  [static]
```

Render a Page to an Avalonia.Controls.Canvas.

Parameters

page	The Page to render.
textOption	Defines whether text items should be converted into paths when drawing.
filterOption	Defines how and whether image filters should be rasterised when rendering the image.

Returns

An Avalonia.Controls.Canvas containing the rendered graphics objects.

Definition at line 2635 of file AvaloniaContext.cs.

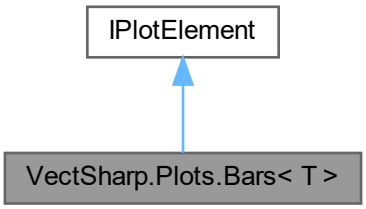
The documentation for this class was generated from the following file:

- VectSharp.Canvas/AvaloniaContext.cs

7.9 VectSharp.Plots.Bars< T > Class Template Reference

A plot element that draws bars.

Inheritance diagram for VectSharp.Plots.Bars< T >:



Public Member Functions

- Bars (IEnumerable< T > data, IComparer< T > sorting, Func< T, T > getBaseline, ICoordinateSystem< T > coordinateSystem)

  Create a new Bars<T> instance.
- Bars (IEnumerable< T > data, Comparison< T > sorting, Func< T, T > getBaseline, ICoordinateSystem< T > coordinateSystem)

  Create a new Bars<T> instance.
- Bars (IReadOnlyList< T > data, Func< T, T > getBaseline, ICoordinateSystem< T > coordinateSystem)

  Create a new Bars<T> instance.
- void Plot (Graphics target)

  Draw the plot element on the specified target Graphics.

Parameters

target	*The Graphics on which to draw.*

- Bars (IEnumerable< IReadOnlyList< double > > data, IComparer< IReadOnlyList< double > > sorting, Func< IReadOnlyList< double >, IReadOnlyList< double > > getBaseline, ICoordinateSystem< IRead↩ OnlyList< double > > coordinateSystem)

  Create a new Bars instance.
- Bars (IEnumerable< IReadOnlyList< double > > data, Comparison< IReadOnlyList< double > > sorting, Func< IReadOnlyList< double >, IReadOnlyList< double > > getBaseline, ICoordinateSystem< IRead↩ OnlyList< double > > coordinateSystem)

  Create a new Bars instance.
- Bars (IEnumerable< IReadOnlyList< double > > data, ICoordinateSystem< IReadOnlyList< double > > coordinateSystem, bool vertical=true)

  Create a new Bars instance.

Properties

- SortedSet< T > Data `[get, set]`

  The data points corresponding to the tips of the bars.
- Func< T, T > GetBaseline `[get, set]`

  A function that returns the bottom for each bar. This function should accept a single parameter of type T and return another T object, representing the bottom of the bar in data space.
- double Margin `[get, set]`

  The margin between consecutive bars. This should range between 0 and 1.
- ICoordinateSystem< T > CoordinateSystem `[get, set]`

  The coordinate system used to transform the points from data space to plot space.
- PlotElementPresentationAttributes PresentationAttributes = new PlotElementPresentationAttributes() `[get, set]`

  Presentation attributes for the bars.
- string Tag `[get, set]`

  A tag to identify the bars in the plot.

7.9.1 Detailed Description

A plot element that draws bars.

A plot element that draws bars for numerical data.

Template Parameters

T	The type of data elements.

Definition at line 29 of file Bars.cs.

7.9.2 Constructor & Destructor Documentation

7.9.2.1 Bars() [1/6]

```
VectSharp.Plots.Bars< T >.Bars (
            IEnumerable< T > data,
            IComparer< T > sorting,
            Func< T, T > getBaseline,
            ICoordinateSystem< T > coordinateSystem )
```

Create a new Bars<T> instance.

Parameters

data	The data points corresponding to the tips of the bars.
sorting	A comparer used to sort the bars.
getBaseline	A function that returns the bottom for each bar. This function should accept a single parameter of type *T* and return another *T* object, representing the bottom of the bar in data space.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 89 of file Bars.cs.

7.9.2.2 Bars() [2/6]

```
VectSharp.Plots.Bars< T >.Bars (
            IEnumerable< T > data,
            Comparison< T > sorting,
            Func< T, T > getBaseline,
            ICoordinateSystem< T > coordinateSystem )
```

Create a new Bars<T> instance.

Parameters

data	The data points corresponding to the tips of the bars.
sorting	A comparer used to sort the bars.
getBaseline	A function that returns the bottom for each bar. This function should accept a single parameter of type *T* and return another *T* object, representing the bottom of the bar in data space.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 105 of file Bars.cs.

7.9.2.3 Bars() [3/6]

```
VectSharp.Plots.Bars< T >.Bars (
            IReadOnlyList< T > data,
```

```
            Func< T, T > getBaseline,
            ICoordinateSystem< T > coordinateSystem )
```

Create a new Bars<T> instance.

Parameters

data	The data points corresponding to the tips of the bars. These should already be sorted.
getBaseline	A function that returns the bottom for each bar. This function should accept a single parameter of type *T* and return another *T* object, representing the bottom of the bar in data space.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 115 of file Bars.cs.

7.9.2.4 Bars() [4/6]

```
VectSharp.Plots.Bars< T >.Bars (
            IEnumerable< IReadOnlyList< double > > data,
            IComparer< IReadOnlyList< double > > sorting,
            Func< IReadOnlyList< double >, IReadOnlyList< double > > getBaseline,
            ICoordinateSystem< IReadOnlyList< double > > coordinateSystem )
```

Create a new Bars instance.

Parameters

data	The data points corresponding to the tips of the bars.
sorting	A comparer used to sort the bars.
getBaseline	A function that returns the bottom for each bar. This function should accept a single parameter (an IReadOnlyList<T> of `double`s), and return another object of the same type, representing the bottom of the bar in data space.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 299 of file Bars.cs.

7.9.2.5 Bars() [5/6]

```
VectSharp.Plots.Bars< T >.Bars (
            IEnumerable< IReadOnlyList< double > > data,
            Comparison< IReadOnlyList< double > > sorting,
            Func< IReadOnlyList< double >, IReadOnlyList< double > > getBaseline,
            ICoordinateSystem< IReadOnlyList< double > > coordinateSystem )
```

Create a new Bars instance.

Parameters

data	The data points corresponding to the tips of the bars.
sorting	A comparer used to sort the bars.
getBaseline	A function that returns the bottom for each bar. This function should accept a single parameter (an IReadOnlyList<T> of `double`s), and return another object of the same type, representing the bottom of the bar in data space.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 310 of file Bars.cs.

7.9.2.6 Bars() [6/6]

```
VectSharp.Plots.Bars< T >.Bars (
            IEnumerable< IReadOnlyList< double > > data,
            ICoordinateSystem< IReadOnlyList< double > > coordinateSystem,
            bool vertical = true )
```

Create a new Bars instance.

Parameters

data	The data points corresponding to the tips of the bars.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.
vertical	If this is `true` (the default), the bars rise vertically above the X axis Otherwise, the bars grow horizontally from the Y axis.

Definition at line 319 of file Bars.cs.

7.9.3 Member Function Documentation

7.9.3.1 Plot()

```
void VectSharp.Plots.Bars< T >.Plot (
            Graphics target )
```

Draw the plot element on the specified *target* Graphics.

Parameters

target	The Graphics on which to draw.

Implements VectSharp.Plots.IPlotElement.

Definition at line 143 of file Bars.cs.

7.9.4 Property Documentation

7.9.4.1 CoordinateSystem

```
ICoordinateSystem<T> VectSharp.Plots.Bars< T >.CoordinateSystem  [get], [set]
```

The coordinate system used to transform the points from data space to plot space.

Implements VectSharp.Plots.IPlotElement.

Definition at line 67 of file Bars.cs.

7.9.4.2 Data

```
SortedSet<T> VectSharp.Plots.Bars< T >.Data  [get], [set]
```

The data points corresponding to the tips of the bars.

Definition at line 36 of file Bars.cs.

7.9.4.3 GetBaseline

```
Func<T, T> VectSharp.Plots.Bars< T >.GetBaseline  [get], [set]
```

A function that returns the bottom for each bar. This function should accept a single parameter of type *T* and return another *T* object, representing the bottom of the bar in data space.

Definition at line 43 of file Bars.cs.

7.9.4.4 Margin

```
double VectSharp.Plots.Bars< T >.Margin  [get], [set]
```

The margin between consecutive bars. This should range between 0 and 1.

Definition at line 48 of file Bars.cs.

7.9.4.5 PresentationAttributes

```
PlotElementPresentationAttributes VectSharp.Plots.Bars< T >.PresentationAttributes = new
PlotElementPresentationAttributes()  [get], [set]
```

Presentation attributes for the bars.

Definition at line 73 of file Bars.cs.

7.9.4.6 Tag

```
string VectSharp.Plots.Bars< T >.Tag  [get], [set]
```

A tag to identify the bars in the plot.

Definition at line 78 of file Bars.cs.

The documentation for this class was generated from the following file:

- VectSharp.Plots/Bars.cs

7.10 VectSharp.TrueTypeFile.Bearings Struct Reference

Represents the left- and right-side bearings of a glyph.

Public Attributes

- int LeftSideBearing

  The left-side bearing of the glyph.
- int RightSideBearing

  The right-side bearing of the glyph.

7.10.1 Detailed Description

Represents the left- and right-side bearings of a glyph.

Definition at line 2319 of file TrueType.cs.

7.10.2 Member Data Documentation

7.10.2.1 LeftSideBearing

```
int VectSharp.TrueTypeFile.Bearings.LeftSideBearing
```

The left-side bearing of the glyph.

Definition at line 2324 of file TrueType.cs.

7.10.2.2 RightSideBearing

```
int VectSharp.TrueTypeFile.Bearings.RightSideBearing
```

The right-side bearing of the glyph.

Definition at line 2329 of file TrueType.cs.

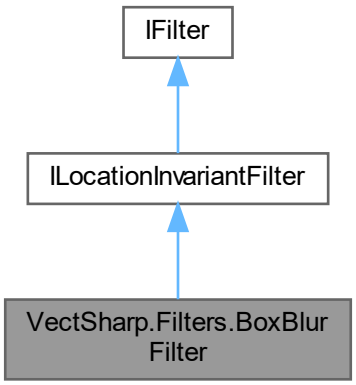
The documentation for this struct was generated from the following file:

- VectSharp/TrueType.cs

7.11 VectSharp.Filters.BoxBlurFilter Class Reference

Represents a filter applying a box blur.

Inheritance diagram for VectSharp.Filters.BoxBlurFilter:



Public Member Functions

- BoxBlurFilter (double boxRadius)

  Creates a new BoxBlurFilter with the specified radius.
- RasterImage Filter (RasterImage image, double scale)

  Applies the filter to a RasterImage.

Parameters

image	*The RasterImage to which the filter will be applied.*
scale	*The scale of the image with respect to the filter.*

Returns

A new RasterImage containing the filtered image. The source image is left unaltered.

Properties

- double BoxRadius `[get]`

  The radius of the box blur (the actual size of the box is 2 ∗ BoxRadius + 1).
- Point TopLeftMargin `[get]`

  Determines how much the area of the filter's subject should be expanded on the top-left to accommodate the results of the filter.
- Point BottomRightMargin `[get]`

  Determines how much the area of the filter's subject should be expanded on the bottom-right to accommodate the results of the filter.

7.11.1 Detailed Description

Represents a filter applying a box blur.

Definition at line 26 of file BoxBlurFilter.cs.

7.11.2 Constructor & Destructor Documentation

7.11.2.1 BoxBlurFilter()

```
VectSharp.Filters.BoxBlurFilter.BoxBlurFilter (
            double boxRadius )
```

Creates a new BoxBlurFilter with the specified radius.

Parameters

boxRadius	The radius of the box blur (the actual size of the box is 2 ∗ *boxRadius* + 1).

Definition at line 42 of file BoxBlurFilter.cs.

7.11.3 Member Function Documentation

7.11.3.1 Filter()

```
RasterImage VectSharp.Filters.BoxBlurFilter.Filter (
            RasterImage image,
            double scale )
```

Applies the filter to a RasterImage.

Parameters

image	The RasterImage to which the filter will be applied.
scale	The scale of the image with respect to the filter.

Returns

A new RasterImage containing the filtered image. The source *image* is left unaltered.

Implements VectSharp.Filters.ILocationInvariantFilter.

Definition at line 50 of file BoxBlurFilter.cs.

7.11.4 Property Documentation

7.11.4.1 BottomRightMargin

```
Point VectSharp.Filters.BoxBlurFilter.BottomRightMargin  [get]
```

Determines how much the area of the filter's subject should be expanded on the bottom-right to accommodate the results of the filter.

Implements VectSharp.Filters.IFilter.

Definition at line 36 of file BoxBlurFilter.cs.

7.11.4.2 BoxRadius

```
double VectSharp.Filters.BoxBlurFilter.BoxRadius  [get]
```

The radius of the box blur (the actual size of the box is 2 ∗ BoxRadius + 1).

Definition at line 31 of file BoxBlurFilter.cs.

7.11.4.3 TopLeftMargin

```
Point VectSharp.Filters.BoxBlurFilter.TopLeftMargin [get]
```

Determines how much the area of the filter's subject should be expanded on the top-left to accommodate the results of the filter.

Implements VectSharp.Filters.IFilter.

Definition at line 34 of file BoxBlurFilter.cs.

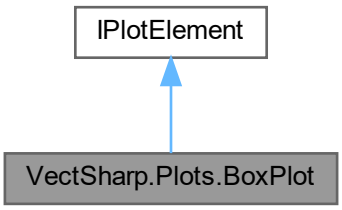
The documentation for this class was generated from the following file:

- VectSharp/Filters/BoxBlurFilter.cs

7.12 VectSharp.Plots.BoxPlot Class Reference

A plot element that draws a box plot.

Inheritance diagram for VectSharp.Plots.BoxPlot:



Public Member Functions

- BoxPlot (IReadOnlyList< double > position, IReadOnlyList< double > direction, double whisker1, double box1, double box2, double whisker2, ICoordinateSystem< IReadOnlyList< double > > coordinateSystem)

  Create a new BoxPlot instance.
- void Plot (Graphics target)

  Draw the plot element on the specified target Graphics.

Parameters

target	*The Graphics on which to draw.*

Properties

- IReadOnlyList< double > Position [get, set]

  The position of the centre (e.g., median or mean) of the box plot, in data space coordinates.
- IReadOnlyList< double > Direction [get, set]

  The direction along which the box plot is drawn, in data space coordinates.
- double Whisker1 [get, set]

  The distance between the centre of the box plot and the first whisker, expressed as a multiple of Direction.
- double Box1 [get, set]

  The distance between the centre of the box plot and the first side of the box, expressed as a multiple of Direction.
- double Box2 [get, set]

  The distance between the centre of the box plot and the second side of the box, expressed as a multiple of Direction.
- double Whisker2 [get, set]

  The distance between the centre of the box plot and the second whisker, expressed as a multiple of Direction.
- double Width = 10 [get, set]

  The width of the box plot, in data space coordinates.
- double WhiskerWidth = 0.5 [get, set]

  The width of the whiskers, expressed as a multiple of the Width of the box.
- double NotchWidth = 0.5 [get, set]

  The width of the notch, expressed as a multiple of the Width of the box.
- double NotchSize = 0 [get, set]

  The distance between the centre of the box plot and the end of the notch, expressed as a multiple of Direction.
- PlotElementPresentationAttributes BoxPresentationAttributes = new PlotElementPresentationAttributes() { Fill = Colours.White } [get, set]

  Presentation attributes for the box.
- PlotElementPresentationAttributes WhiskersPresentationAttributes = new PlotElementPresentationAttributes() { Fill = null } [get, set]

  Presentation attributes for the whiskers.
- PlotElementPresentationAttributes CentreSymbolPresentationAttributes = new PlotElementPresentationAttributes() { Fill = null, Stroke = null } [get, set]

  Presentation attributes for the symbol drawn at the centre of the box plot.
- IDataPointElement CentreSymbol = new PathDataPointElement() [get, set]

  Symbol drawn at the centre of the box plot.
- ICoordinateSystem< IReadOnlyList< double > > CoordinateSystem [get, set]

  The coordinate system used to transform the points from data space to plot space.
- string Tag [get, set]

  A tag to identify the box in the plot.

7.12.1 Detailed Description

A plot element that draws a box plot.

Definition at line 26 of file BoxPlot.cs.

7.12.2 Constructor & Destructor Documentation

7.12.2.1 BoxPlot()

```
VectSharp.Plots.BoxPlot.BoxPlot (
            IReadOnlyList< double > position,
            IReadOnlyList< double > direction,
            double whisker1,
            double box1,
            double box2,
            double whisker2,
            ICoordinateSystem< IReadOnlyList< double > > coordinateSystem )
```

Create a new BoxPlot instance.

Parameters

position	The position of the centre (e.g., median or mean) of the box plot, in data space coordinates.
direction	The direction along which the box plot is drawn, in data space coordinates.
whisker1	The distance between the centre of the box plot and the first whisker, expressed as a multiple of *direction* .
box1	The distance between the centre of the box plot and the first side of the box, expressed as a multiple of *direction* .
box2	The distance between the centre of the box plot and the second side of the box, expressed as a multiple of *direction* .
whisker2	The distance between the centre of the box plot and the second whisker, expressed as a multiple of *direction* .
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 129 of file BoxPlot.cs.

7.12.3 Member Function Documentation

7.12.3.1 Plot()

```
void VectSharp.Plots.BoxPlot.Plot (
            Graphics target )
```

Draw the plot element on the specified *target* Graphics.

Parameters

target	The Graphics on which to draw.

Implements VectSharp.Plots.IPlotElement.

Definition at line 141 of file BoxPlot.cs.

7.12.4 Property Documentation

7.12.4.1 Box1

```
double VectSharp.Plots.BoxPlot.Box1  [get], [set]
```

The distance between the centre of the box plot and the first side of the box, expressed as a multiple of Direction.

Definition at line 48 of file BoxPlot.cs.

7.12.4.2 Box2

```
double VectSharp.Plots.BoxPlot.Box2  [get], [set]
```

The distance between the centre of the box plot and the second side of the box, expressed as a multiple of Direction.

Definition at line 54 of file BoxPlot.cs.

7.12.4.3 BoxPresentationAttributes

```
PlotElementPresentationAttributes VectSharp.Plots.BoxPlot.BoxPresentationAttributes = new
PlotElementPresentationAttributes() { Fill = Colours.White }  [get], [set]
```

Presentation attributes for the box.

Definition at line 86 of file BoxPlot.cs.

7.12.4.4 CentreSymbol

```
IDataPointElement VectSharp.Plots.BoxPlot.CentreSymbol = new PathDataPointElement()  [get],
[set]
```

Symbol drawn at the centre of the box plot.

Definition at line 101 of file BoxPlot.cs.

7.12.4.5 CentreSymbolPresentationAttributes

```
PlotElementPresentationAttributes VectSharp.Plots.BoxPlot.CentreSymbolPresentationAttributes =
new PlotElementPresentationAttributes() { Fill = null, Stroke = null }  [get], [set]
```

Presentation attributes for the symbol drawn at the centre of the box plot.

Definition at line 96 of file BoxPlot.cs.

7.12.4.6 CoordinateSystem

```
ICoordinateSystem<IReadOnlyList<double> > VectSharp.Plots.BoxPlot.CoordinateSystem  [get],
[set]
```

The coordinate system used to transform the points from data space to plot space.

Implements VectSharp.Plots.IPlotElement.

Definition at line 106 of file BoxPlot.cs.

7.12.4.7 Direction

```
IReadOnlyList<double> VectSharp.Plots.BoxPlot.Direction  [get], [set]
```

The direction along which the box plot is drawn, in data space coordinates.

Definition at line 36 of file BoxPlot.cs.

7.12.4.8 NotchSize

```
double VectSharp.Plots.BoxPlot.NotchSize = 0  [get], [set]
```

The distance between the centre of the box plot and the end of the notch, expressed as a multiple of Direction.

Definition at line 81 of file BoxPlot.cs.

7.12.4.9 NotchWidth

```
double VectSharp.Plots.BoxPlot.NotchWidth = 0.5  [get], [set]
```

The width of the notch, expressed as a multiple of the Width of the box.

Definition at line 75 of file BoxPlot.cs.

7.12.4.10 Position

```
IReadOnlyList<double> VectSharp.Plots.BoxPlot.Position  [get], [set]
```

The position of the centre (e.g., median or mean) of the box plot, in data space coordinates.

Definition at line 31 of file BoxPlot.cs.

7.12.4.11 Tag

```
string VectSharp.Plots.BoxPlot.Tag  [get], [set]
```

A tag to identify the box in the plot.

Definition at line 111 of file BoxPlot.cs.

7.12.4.12 Whisker1

```
double VectSharp.Plots.BoxPlot.Whisker1  [get], [set]
```

The distance between the centre of the box plot and the first whisker, expressed as a multiple of Direction.

Definition at line 42 of file BoxPlot.cs.

7.12.4.13 Whisker2

```
double VectSharp.Plots.BoxPlot.Whisker2  [get], [set]
```

The distance between the centre of the box plot and the second whisker, expressed as a multiple of Direction.

Definition at line 60 of file BoxPlot.cs.

7.12.4.14 WhiskersPresentationAttributes

```
PlotElementPresentationAttributes VectSharp.Plots.BoxPlot.WhiskersPresentationAttributes = new
PlotElementPresentationAttributes() { Fill = null }  [get], [set]
```

Presentation attributes for the whiskers.

Definition at line 91 of file BoxPlot.cs.

7.12.4.15 WhiskerWidth

```
double VectSharp.Plots.BoxPlot.WhiskerWidth = 0.5  [get], [set]
```

The width of the whiskers, expressed as a multiple of the Width of the box.

Definition at line 70 of file BoxPlot.cs.

7.12.4.16 Width

```
double VectSharp.Plots.BoxPlot.Width = 10  [get], [set]
```

The width of the box plot, in data space coordinates.

Definition at line 65 of file BoxPlot.cs.

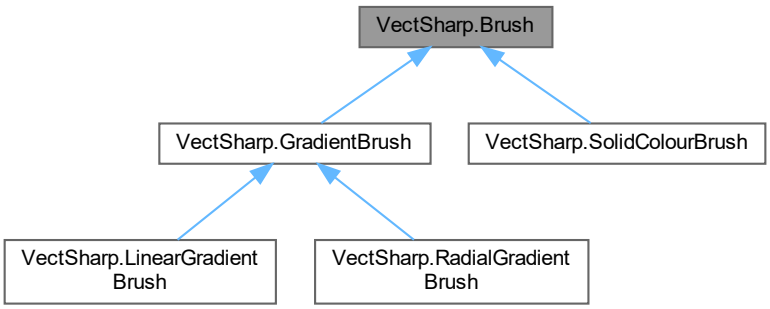
7.13 VectSharp.Brush Class Reference

Represents a brush used to fill or stroke graphics elements. This could be a solid colour, or a more complicated gradient or pattern.

Inheritance diagram for VectSharp.Brush:



Public Member Functions

- abstract Brush MultiplyOpacity (double opacity)

  Returns a brush corresponding the current instance, with the specified opacity multiplication applied.

Static Public Member Functions

- static implicit operator Brush (Colour colour)

  Implicitly converts a Colour into a SolidColourBrush.

7.13.1 Detailed Description

Represents a brush used to fill or stroke graphics elements. This could be a solid colour, or a more complicated gradient or pattern.

Definition at line 30 of file Brush.cs.

7.13.2 Member Function Documentation

7.13.2.1 MultiplyOpacity()

```
abstract Brush VectSharp.Brush.MultiplyOpacity (
            double opacity )  [pure virtual]
```

Returns a brush corresponding the current instance, with the specified *opacity* multiplication applied.

Parameters

opacity	The value that will be used to multiply the opacity of the brush.

Returns

A brush corresponding the current instance, with the specified *opacity* multiplication applied.

Implemented in VectSharp.SolidColourBrush, VectSharp.LinearGradientBrush, and VectSharp.RadialGradientBrush.

7.13.2.2 operator Brush()

```
static implicit VectSharp.Brush.operator Brush (
            Colour colour )  [static]
```

Implicitly converts a Colour into a SolidColourBrush.

Parameters

colour	The Colour to use for the brush.

Definition at line 45 of file Brush.cs.

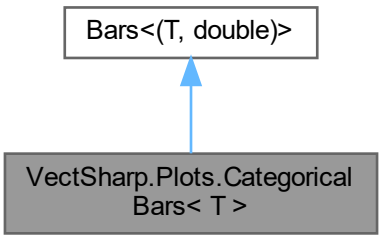
The documentation for this class was generated from the following file:

- VectSharp/Brush.cs

7.14 VectSharp.Plots.CategoricalBars< T > Class Template Reference

A plot element that draws bars for categorical data.

Inheritance diagram for VectSharp.Plots.CategoricalBars< T >:



Public Member Functions

- CategoricalBars (IEnumerable<(T, double)> data, IComparer<(T, double)> sorting, Func<(T, double),(T, double)> getBaseline, ICoordinateSystem<(T, double)> coordinateSystem)

  Create a new CategoricalBars<T> instance.
- CategoricalBars (IEnumerable<(T, double)> data, Comparison<(T, double)> sorting, Func<(T, double),(T, double)> getBaseline, ICoordinateSystem<(T, double)> coordinateSystem)

  Create a new CategoricalBars<T> instance.
- CategoricalBars (IEnumerable<(T, double)> data, Comparison<(T, double)> sorting, ICoordinateSystem<(T, double)> coordinateSystem)

  Create a new Bars<T> instance. The baseline for each `(T x, double y)` is determined automatically as `(x, 0)`.
- CategoricalBars (IReadOnlyList<(T, double)> data, ICoordinateSystem<(T, double)> coordinateSystem)

  Create a new Bars<T> instance. The baseline for each `(T x, double y)` is determined automatically as `(x, 0)`.

Additional Inherited Members

7.14.1 Detailed Description

A plot element that draws bars for categorical data.

Template Parameters

T	The type of the data categories.

Definition at line 245 of file Bars.cs.

7.14.2 Constructor & Destructor Documentation

7.14.2.1 CategoricalBars() [1/4]

```
VectSharp.Plots.CategoricalBars< T >.CategoricalBars (
            IEnumerable<(T, double)> data,
            IComparer<(T, double)> sorting,
            Func<(T, double),(T, double)> getBaseline,
            ICoordinateSystem<(T, double)> coordinateSystem )
```

Create a new CategoricalBars<T> instance.

Parameters

data	The data points corresponding to the tips of the bars.
sorting	A comparer used to sort the bars.
getBaseline	A function that returns the bottom for each bar. This function should accept a single parameter of type *T* and return another *T* object, representing the bottom of the bar in data space.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 256 of file Bars.cs.

7.14.2.2 CategoricalBars() [2/4]

```
VectSharp.Plots.CategoricalBars< T >.CategoricalBars (
            IEnumerable<(T, double)> data,
            Comparison<(T, double)> sorting,
            Func<(T, double),(T, double)> getBaseline,
            ICoordinateSystem<(T, double)> coordinateSystem )
```

Create a new CategoricalBars<T> instance.

Parameters

data	The data points corresponding to the tips of the bars.
sorting	A comparer used to sort the bars.
getBaseline	A function that returns the bottom for each bar. This function should accept a single parameter of type *T* and return another *T* object, representing the bottom of the bar in data space.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 267 of file Bars.cs.

7.14.2.3 CategoricalBars() [3/4]

```
VectSharp.Plots.CategoricalBars< T >.CategoricalBars (
            IEnumerable<(T, double)> data,
            Comparison<(T, double)> sorting,
            ICoordinateSystem<(T, double)> coordinateSystem )
```

Create a new Bars<T> instance. The baseline for each `(T x, double y)` is determined automatically as `(x, 0)`.

Parameters

data	The data points corresponding to the tips of the bars.
sorting	A comparer used to sort the bars.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 275 of file Bars.cs.

7.14.2.4 CategoricalBars() [4/4]

```
VectSharp.Plots.CategoricalBars< T >.CategoricalBars (
            IReadOnlyList<(T, double)> data,
            ICoordinateSystem<(T, double)> coordinateSystem )
```

Create a new Bars<T> instance. The baseline for each `(T x, double y)` is determined automatically as `(x, 0)`.

Parameters

data	The data points corresponding to the tips of the bars. These should already be sorted.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 282 of file Bars.cs.

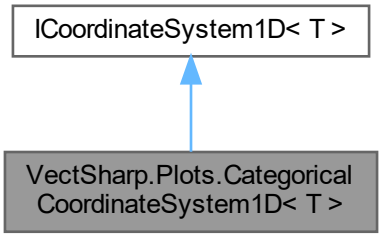
The documentation for this class was generated from the following file:

- VectSharp.Plots/Bars.cs

7.15 VectSharp.Plots.CategoricalCoordinateSystem1D< T > Class Template Reference

Represents a categorical 1-D coordinate system.

Inheritance diagram for VectSharp.Plots.CategoricalCoordinateSystem1D< T >:



Public Member Functions

- CategoricalCoordinateSystem1D (Dictionary< T, double > coordinates)

  Creates a new CategoricalCoordinateSystem1D<T> using the coordinates specified in the supplied coordinates Dictionary<TKey, TValue>.
- CategoricalCoordinateSystem1D (IReadOnlyList< T > data, double scale=350)

  Creates a new CategoricalCoordinateSystem1D<T> assigning equally-spaced coordinates to all different values of data .
- double ToPlotCoordinates (T dataPoint)

  Transform the specified dataPoint into a `double`*.*

Parameters

dataPoint	*The data point whose coordinates should be determined.*

Returns

A `double` *representing the dataPoint in plot space.*

Properties

- Dictionary< T, double > Coordinates `[get, set]`

  A Dictionary<TKey, TValue> storing the coordinates.

7.15.1 Detailed Description

Represents a categorical 1-D coordinate system.

Template Parameters

T	The type of data elements.

Definition at line 1082 of file CoordinateSystems.cs.

7.15.2 Constructor & Destructor Documentation

7.15.2.1 CategoricalCoordinateSystem1D() [1/2]

```
VectSharp.Plots.CategoricalCoordinateSystem1D< T >.CategoricalCoordinateSystem1D (
            Dictionary< T, double > coordinates )
```

Creates a new CategoricalCoordinateSystem1D<T> using the coordinates specified in the supplied *coordinates* Dictionary<TKey, TValue>.

Parameters

coordinates	

Definition at line 1093 of file CoordinateSystems.cs.

7.15.2.2 CategoricalCoordinateSystem1D() [2/2]

```
VectSharp.Plots.CategoricalCoordinateSystem1D< T >.CategoricalCoordinateSystem1D (
            IReadOnlyList< T > data,
            double scale = 350 )
```

Creates a new CategoricalCoordinateSystem1D<T> assigning equally-spaced coordinates to all different values of *data* .

Parameters

data	The data containing discrete parameter values that should be assigned to different coordinates.
scale	The maximum coordinate.

Definition at line 1103 of file CoordinateSystems.cs.

7.15.3 Member Function Documentation

7.15.3.1 ToPlotCoordinates()

```
double VectSharp.Plots.CategoricalCoordinateSystem1D< T >.ToPlotCoordinates (
            T dataPoint )
```

Transform the specified *dataPoint* into a `double`.

Parameters

dataPoint	The data point whose coordinates should be determined.

Returns

A `double` representing the *dataPoint* in plot space.

Implements VectSharp.Plots.ICoordinateSystem1D< T >.

Definition at line 1125 of file CoordinateSystems.cs.

7.15.4 Property Documentation

7.15.4.1 Coordinates

```
Dictionary<T, double> VectSharp.Plots.CategoricalCoordinateSystem1D< T >.Coordinates  [get],
[set]
```

A Dictionary<TKey, TValue> storing the coordinates.

Definition at line 1087 of file CoordinateSystems.cs.

The documentation for this class was generated from the following file:

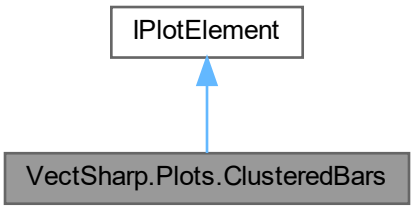
The documentation for this struct was generated from the following file:

- VectSharp/TrueType.cs

7.17 VectSharp.Plots.ClusteredBars Class Reference

A plot element that draws clusters of bars.

Inheritance diagram for VectSharp.Plots.ClusteredBars:



Public Member Functions

- ClusteredBars (IEnumerable< IReadOnlyList< double > > data, IComparer< IReadOnlyList< double > > sorting, Func< IReadOnlyList< double >, IReadOnlyList< double > > getBaseline, ICoordinateSystem< IReadOnlyList< double > > coordinateSystem)

  Create a new ClusteredBars instance.
- ClusteredBars (IEnumerable< IReadOnlyList< double > > data, Comparison< IReadOnlyList< double > > sorting, Func< IReadOnlyList< double >, IReadOnlyList< double > > getBaseline, ICoordinateSystem< IReadOnlyList< double > > coordinateSystem)

  Create a new ClusteredBars instance.
- ClusteredBars (IEnumerable< IReadOnlyList< double > > data, ICoordinateSystem< IReadOnlyList< double > > coordinateSystem, bool vertical=true)

  Create a new ClusteredBars instance.
- void Plot (Graphics target)

  Draw the plot element on the specified target Graphics.

Parameters

target	*The Graphics on which to draw.*

Properties

- bool Vertical = true `[get, set]`

  If this is `true`, the bars rise vertically above the X axis Otherwise, the bars grow horizontally from the Y axis.
- SortedSet< IReadOnlyList< double > > Data `[get, set]`

  The data points corresponding to the tips of the bars. For each bar cluster, the data point contains an element determining the position of the cluster on the X axis (if Vertical is `true`, or on the Y axis otherwise), and a set of elements determining the length of each bar in the cluster.
- Func< IReadOnlyList< double >, IReadOnlyList< double > > GetBaseline `[get, set]`

A function that returns the bottom for each bar cluster. This function should accept a single parameter (an IReadOnlyList<T> of doubles), and return another object of the same type, representing the bottom of the cluster in data space.

- double InterClusterMargin [get, set]

  The margin between consecutive bar clusters.
- double IntraClusterMargin [get, set]

  The margin between consecutive bars within a single cluster.
- ICoordinateSystem< IReadOnlyList< double > > CoordinateSystem [get, set]

  The coordinate system used to transform the points from data space to plot space.
- IReadOnlyList< PlotElementPresentationAttributes > PresentationAttributes = new PlotElementPresentationAttributes[ ] { new PlotElementPresentationAttributes() } [get, set]

  Presentation attributes for the bars. An element from this collection is used for each bar in the cluster; if there are more bars than elements in this collection, the presentation attributes are wrapped.
- string Tag [get, set]

  A tag to identify the clustered bars in the plot.

7.17.1 Detailed Description

A plot element that draws clusters of bars.

Definition at line 595 of file Bars.cs.

7.17.2 Constructor & Destructor Documentation

7.17.2.1 ClusteredBars() [1/3]

```
VectSharp.Plots.ClusteredBars.ClusteredBars (
            IEnumerable< IReadOnlyList< double > > data,
            IComparer< IReadOnlyList< double > > sorting,
            Func< IReadOnlyList< double >, IReadOnlyList< double > > getBaseline,
            ICoordinateSystem< IReadOnlyList< double > > coordinateSystem )
```

Create a new ClusteredBars instance.

Parameters

data	The data points corresponding to the tips of the bars. For each bar cluster, the data point contains an element determining the position of the cluster on the X axis (if Vertical is true, or on the Y axis otherwise), and a set of elements determining the length of each bar in the cluster.
sorting	A comparer used to sort the bar clusters.
getBaseline	A function that returns the bottom for each bar cluster. This function should accept a single parameter (an IReadOnlyList<T> of doubles), and return another object of the same type, representing the bottom of the cluster in data space.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 691 of file Bars.cs.

7.17.2.2 ClusteredBars() [2/3]

```
VectSharp.Plots.ClusteredBars.ClusteredBars (
            IEnumerable< IReadOnlyList< double > > data,
            Comparison< IReadOnlyList< double > > sorting,
            Func< IReadOnlyList< double >, IReadOnlyList< double > > getBaseline,
            ICoordinateSystem< IReadOnlyList< double > > coordinateSystem )
```

Create a new ClusteredBars instance.

Parameters

data	The data points corresponding to the tips of the bars. For each bar cluster, the data point contains an element determining the position of the cluster on the X axis (if Vertical is `true`, or on the Y axis otherwise), and a set of elements determining the length of each bar in the cluster.
sorting	A comparer used to sort the bar clusters.
getBaseline	A function that returns the bottom for each bar cluster. This function should accept a single parameter (an IReadOnlyList<T> of `double`s), and return another object of the same type, representing the bottom of the cluster in data space.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 710 of file Bars.cs.

7.17.2.3 ClusteredBars() [3/3]

```
VectSharp.Plots.ClusteredBars.ClusteredBars (
            IEnumerable< IReadOnlyList< double > > data,
            ICoordinateSystem< IReadOnlyList< double > > coordinateSystem,
            bool vertical = true )
```

Create a new ClusteredBars instance.

Parameters

data	The data points corresponding to the tips of the bars. For each bar cluster, the data point contains an element determining the position of the cluster on the X axis (if Vertical is `true`, or on the Y axis otherwise), and a set of elements determining the length of each bar in the cluster.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.
vertical	If this is `true` (the default), the bars rise vertically above the X axis Otherwise, the bars grow horizontally from the Y axis.

Definition at line 722 of file Bars.cs.

7.17.3 Member Function Documentation

7.17.3.1 Plot()

```
void VectSharp.Plots.ClusteredBars.Plot (
            Graphics target )
```

Draw the plot element on the specified *target* Graphics.

Parameters

target	The Graphics on which to draw.

Implements VectSharp.Plots.IPlotElement.

Definition at line 725 of file Bars.cs.

7.17.4 Property Documentation

7.17.4.1 CoordinateSystem

```
ICoordinateSystem<IReadOnlyList<double> > VectSharp.Plots.ClusteredBars.CoordinateSystem
[get], [set]
```

The coordinate system used to transform the points from data space to plot space.

Implements VectSharp.Plots.IPlotElement.

Definition at line 663 of file Bars.cs.

7.17.4.2 Data

```
SortedSet<IReadOnlyList<double> > VectSharp.Plots.ClusteredBars.Data  [get], [set]
```

The data points corresponding to the tips of the bars. For each bar cluster, the data point contains an element determining the position of the cluster on the X axis (if Vertical is `true`, or on the Y axis otherwise), and a set of elements determining the length of each bar in the cluster.

Definition at line 613 of file Bars.cs.

7.17.4.3 GetBaseline

```
Func<IReadOnlyList<double>, IReadOnlyList<double> > VectSharp.Plots.ClusteredBars.Get↩
Baseline  [get], [set]
```

A function that returns the bottom for each bar cluster. This function should accept a single parameter (an IRead↩ OnlyList<T> of `double`s), and return another object of the same type, representing the bottom of the cluster in data space.

Definition at line 620 of file Bars.cs.

7.17.4.4 InterClusterMargin

```
double VectSharp.Plots.ClusteredBars.InterClusterMargin  [get], [set]
```

The margin between consecutive bar clusters.

Definition at line 625 of file Bars.cs.

7.17.4.5 IntraClusterMargin

```
double VectSharp.Plots.ClusteredBars.IntraClusterMargin  [get], [set]
```

The margin between consecutive bars within a single cluster.

Definition at line 644 of file Bars.cs.

7.17.4.6 PresentationAttributes

```
IReadOnlyList<PlotElementPresentationAttributes> VectSharp.Plots.ClusteredBars.Presentation↩
Attributes = new PlotElementPresentationAttributes[] { new PlotElementPresentationAttributes()
}  [get], [set]
```

Presentation attributes for the bars. An element from this collection is used for each bar in the cluster; if there are more bars than elements in this collection, the presentation attributes are wrapped.

Definition at line 671 of file Bars.cs.

7.17.4.7 Tag

```
string VectSharp.Plots.ClusteredBars.Tag  [get], [set]
```

A tag to identify the clustered bars in the plot.

Definition at line 676 of file Bars.cs.

7.17.4.8 Vertical

```
bool VectSharp.Plots.ClusteredBars.Vertical = true  [get], [set]
```

If this is `true`, the bars rise vertically above the X axis Otherwise, the bars grow horizontally from the Y axis.

Definition at line 604 of file Bars.cs.

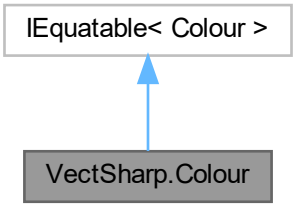
The documentation for this class was generated from the following file:

- VectSharp.Plots/Bars.cs

7.18 VectSharp.Colour Struct Reference

Represents an RGB colour.

Inheritance diagram for VectSharp.Colour:



Public Member Functions

- override bool Equals (object obj)
- bool Equals (Colour col)
- override int GetHashCode ()
- string ToCSSString (bool includeAlpha)

  Convert the Colour object into a hex string that is constituted by a "#" followed by two-digit hexadecimal representations of the red, green and blue components of the colour (in the range 0x00 - 0xFF). Optionally also includes opacity (alpha channel) data.
- Colour WithAlpha (double alpha)

  Create a new Colour with the same RGB components as the current Colour, but with the specified alpha .
- Colour WithAlpha (byte alpha)

  Create a new Colour with the same RGB components as the current Colour, but with the specified alpha .
- double double double Z ToXYZ ()
- double double double b ToLab ()
- double double double L ToHSL ()

Static Public Member Functions

- static Colour FromRgb (double r, double g, double b)

  Create a new colour from RGB (red, green and blue) values.
- static Colour FromRgb (byte r, byte g, byte b)

  Create a new colour from RGB (red, green and blue) values.
- static Colour FromRgb (int r, int g, int b)

  Create a new colour from RGB (red, green and blue) values.
- static Colour FromRgba (double r, double g, double b, double a)

  Create a new colour from RGBA (red, green, blue and alpha) values.
- static Colour FromRgba (byte r, byte g, byte b, byte a)

  Create a new colour from RGBA (red, green, blue and alpha) values.
- static Colour FromRgba (byte r, byte g, byte b, double a)

  Create a new colour from RGBA (red, green, blue and alpha) values.
- static Colour FromRgba (int r, int g, int b, int a)

  Create a new colour from RGBA (red, green, blue and alpha) values.
- static Colour FromRgba (int r, int g, int b, double a)

  Create a new colour from RGBA (red, green, blue and alpha) values.
- static Colour FromRgba ((int r, int g, int b, double a) colour)

  Create a new colour from RGBA (red, green, blue and alpha) values.
- static bool operator== (Colour col1, Colour col2)
- static bool operator!= (Colour col1, Colour col2)
- static ? Colour FromCSSString (string cssString)

  Convert a CSS colour string into a Colour object.
- static Colour WithAlpha (Colour original, double alpha)

  Create a new Colour with the same RGB components as the original Colour, but with the specified alpha .
- static Colour WithAlpha (Colour original, byte alpha)

  Create a new Colour with the same RGB components as the original Colour, but with the specified alpha .
- static Colour FromXYZ (double x, double y, double z)

  Creates a Colour from CIE XYZ coordinates.
- static Colour FromLab (double L, double a, double b)

  Creates a Colour from CIE Lab coordinates (under Illuminant D65).
- static Colour FromHSL (double h, double s, double l)

  Creates a Colour from HSL coordinates.

Public Attributes

- double R

  Red component of the colour. Range: [0, 1].
- double G

  Green component of the colour. Range: [0, 1].
- double B

  Blue component of the colour. Range: [0, 1].
- double A

  Alpha component of the colour. Range: [0, 1].
- double X

  Converts a Colour to the CIE XYZ colour space.
- double double Y
- double L

  Converts a Colour to the CIE Lab colour space (under Illuminant D65).
- double double a
- double H

  Converts a Colour to the HSL colour space.
- double double S

7.18.1 Detailed Description

Represents an RGB colour.

Definition at line 25 of file Colour.cs.

7.18.2 Member Function Documentation

7.18.2.1 Equals() [1/2]

```
bool VectSharp.Colour.Equals (
            Colour col )
```

Definition at line 179 of file Colour.cs.

7.18.2.2 Equals() [2/2]

```
override bool VectSharp.Colour.Equals (
            object obj )
```

Definition at line 166 of file Colour.cs.

7.18.2.3 FromCSSString()

```
static ?  Colour VectSharp.Colour.FromCSSString (
            string cssString )  [static]
```

Convert a CSS colour string into a Colour object.

Parameters

cssString	The CSS colour string. In addition to 148 standard colour names (case-insensitive), #RGB, #RGBA, #RRGGBB and #RRGGBBAA hex strings and rgb(r, g, b) and rgba(r, g, b, a) functional colour notations are supported.

Returns

Definition at line 225 of file Colour.cs.

7.18.2.4 FromHSL()

```
static Colour VectSharp.Colour.FromHSL (
            double h,
            double s,
            double l )  [static]
```

Creates a Colour from HSL coordinates.

Parameters

h	The H component. Should be in range [0, 1].
s	The S component. Should be in range [0, 1].
l	The L component. Should be in range [0, 1].

Returns

A Colour created from the specified components.

Definition at line 582 of file Colour.cs.

7.18.2.5 FromLab()

```
static Colour VectSharp.Colour.FromLab (
            double L,
            double a,
            double b )  [static]
```

Creates a Colour from CIE Lab coordinates (under Illuminant D65).

Parameters

L	The L∗ component.
a	The a∗ component.
b	The b∗ component.

Returns

An sRGB Colour created from the specified components.

Definition at line 504 of file Colour.cs.

7.18.2.6 FromRgb() [1/3]

```
static Colour VectSharp.Colour.FromRgb (
            byte r,
```

```
            byte g,
            byte b )  [static]
```

Create a new colour from RGB (red, green and blue) values.

Parameters

r	The red component of the colour. Range: [0, 255].
g	The green component of the colour. Range: [0, 255].
b	The blue component of the colour. Range: [0, 255].

Returns

A Colour struct with the specified components and an alpha component of 1.

Definition at line 74 of file Colour.cs.

7.18.2.7 FromRgb() [2/3]

```
static Colour VectSharp.Colour.FromRgb (
            double r,
            double g,
            double b )  [static]
```

Create a new colour from RGB (red, green and blue) values.

Parameters

r	The red component of the colour. Range: [0, 1].
g	The green component of the colour. Range: [0, 1].
b	The blue component of the colour. Range: [0, 1].

Returns

A Colour struct with the specified components and an alpha component of 1.

Definition at line 62 of file Colour.cs.

7.18.2.8 FromRgb() [3/3]

```
static Colour VectSharp.Colour.FromRgb (
            int r,
            int g,
            int b )  [static]
```

Create a new colour from RGB (red, green and blue) values.

Parameters

r	The red component of the colour. Range: [0, 255].
g	The green component of the colour. Range: [0, 255].
b	The blue component of the colour. Range: [0, 255].

Returns

A Colour struct with the specified components and an alpha component of 1.

Definition at line 86 of file Colour.cs.

7.18.2.9 FromRgba() [1/6]

```
static Colour VectSharp.Colour.FromRgba (
            (int r, int g, int b, double a) colour )  [static]
```

Create a new colour from RGBA (red, green, blue and alpha) values.

Parameters

colour	A ValueTuple<Int32, Int32, Int32, Double> containing component information for the colour. For r, g, and b, range: [0, 255]; for a, range: [0, 1].

Returns

A Colour struct with the specified components.

Definition at line 160 of file Colour.cs.

7.18.2.10 FromRgba() [2/6]

```
static Colour VectSharp.Colour.FromRgba (
            byte r,
            byte g,
            byte b,
            byte a )  [static]
```

Create a new colour from RGBA (red, green, blue and alpha) values.

Parameters

r	The red component of the colour. Range: [0, 255].
g	The green component of the colour. Range: [0, 255].
b	The blue component of the colour. Range: [0, 255].
a	The alpha component of the colour. Range: [0, 255].

Returns

A ColourColour struct with the specified components.

Definition at line 112 of file Colour.cs.

7.18.2.11 FromRgba() [3/6]

```
static Colour VectSharp.Colour.FromRgba (
            byte r,
            byte g,
            byte b,
            double a )  [static]
```

Create a new colour from RGBA (red, green, blue and alpha) values.

Parameters

r	The red component of the colour. Range: [0, 255].
g	The green component of the colour. Range: [0, 255].
b	The blue component of the colour. Range: [0, 255].
a	The alpha component of the colour. Range: [0, 1].

Returns

A Colour struct with the specified components.

Definition at line 125 of file Colour.cs.

7.18.2.12 FromRgba() [4/6]

```
static Colour VectSharp.Colour.FromRgba (
            double r,
            double g,
            double b,
            double a )  [static]
```

Create a new colour from RGBA (red, green, blue and alpha) values.

Parameters

r	The red component of the colour. Range: [0, 1].
g	The green component of the colour. Range: [0, 1].
b	The blue component of the colour. Range: [0, 1].
a	The alpha component of the colour. Range: [0, 1].

Returns

A Colour struct with the specified components.

Definition at line 99 of file Colour.cs.

7.18.2.13 FromRgba() [5/6]

```
static Colour VectSharp.Colour.FromRgba (
            int r,
            int g,
            int b,
            double a )  [static]
```

Create a new colour from RGBA (red, green, blue and alpha) values.

Parameters

r	The red component of the colour. Range: [0, 255].
g	The green component of the colour. Range: [0, 255].
b	The blue component of the colour. Range: [0, 255].
a	The alpha component of the colour. Range: [0, 1].

Returns

A Colour struct with the specified components.

Definition at line 150 of file Colour.cs.

7.18.2.14 FromRgba() [6/6]

```
static Colour VectSharp.Colour.FromRgba (
            int r,
            int g,
            int b,
            int a )  [static]
```

Create a new colour from RGBA (red, green, blue and alpha) values.

Parameters

r	The red component of the colour. Range: [0, 255].
g	The green component of the colour. Range: [0, 255].
b	The blue component of the colour. Range: [0, 255].
a	The alpha component of the colour. Range: [0, 255].

Returns

A Colour struct with the specified components.

Definition at line 137 of file Colour.cs.

7.18.2.15 FromXYZ()

```
static Colour VectSharp.Colour.FromXYZ (
            double x,
            double y,
            double z )  [static]
```

Creates a Colour from CIE XYZ coordinates.

Parameters

x	The X coordinate.
y	The Y coordinate.
z	The Z coordinate.

Returns

An sRGB Colour created from the specified components.

Definition at line 422 of file Colour.cs.

7.18.2.16 GetHashCode()

```
override int VectSharp.Colour.GetHashCode ( )
```

Definition at line 197 of file Colour.cs.

7.18.2.17 operator"!=()

```
static bool VectSharp.Colour.operator!= (
            Colour col1,
            Colour col2 )  [static]
```

Definition at line 191 of file Colour.cs.

7.18.2.18 operator==()

```
static bool VectSharp.Colour.operator== (
            Colour col1,
            Colour col2 )  [static]
```

Definition at line 185 of file Colour.cs.

7.18.2.19 ToCSSString()

```
string VectSharp.Colour.ToCSSString (
            bool includeAlpha )
```

Convert the Colour object into a hex string that is constituted by a "#" followed by two-digit hexadecimal representations of the red, green and blue components of the colour (in the range 0x00 - 0xFF). Optionally also includes opacity (alpha channel) data.

Parameters

includeAlpha	Whether two additional hex digits representing the colour's opacity (alpha channel) should be included in the string.

Returns

A hex colour string.

Definition at line 208 of file Colour.cs.

7.18.2.20 ToHSL()

```
double double double L VectSharp.Colour.ToHSL ( )
```

Definition at line 535 of file Colour.cs.

7.18.2.21 ToLab()

```
double double double b VectSharp.Colour.ToLab ( )
```

Definition at line 466 of file Colour.cs.

7.18.2.22 ToXYZ()

```
double double double Z VectSharp.Colour.ToXYZ ( )
```

Definition at line 377 of file Colour.cs.

7.18.2.23 WithAlpha() [1/4]

```
Colour VectSharp.Colour.WithAlpha (
            byte alpha )
```

Create a new Colour with the same RGB components as the current Colour, but with the specified *alpha* .

Parameters

alpha	The alpha component of the new Colour.

Returns

A Colour struct with the same RGB components as the current Colour and the specified *alpha* .

Definition at line 368 of file Colour.cs.

7.18.2.24 WithAlpha() [2/4]

```
static Colour VectSharp.Colour.WithAlpha (
            Colour original,
            byte alpha )  [static]
```

Create a new Colour with the same RGB components as the *original* Colour, but with the specified *alpha* .

Parameters

original	The original Colour from which the RGB components will be taken.
alpha	The alpha component of the new Colour.

Returns

A Colour struct with the same RGB components as the *original* Colour and the specified *alpha* .

Definition at line 348 of file Colour.cs.

7.18.2.25 WithAlpha() [3/4]

```
static Colour VectSharp.Colour.WithAlpha (
            Colour original,
            double alpha )  [static]
```

Create a new Colour with the same RGB components as the *original* Colour, but with the specified *alpha* .

Parameters

original	The original Colour from which the RGB components will be taken.
alpha	The alpha component of the new Colour.

Returns

A Colour struct with the same RGB components as the *original* Colour and the specified *alpha* .

Definition at line 337 of file Colour.cs.

7.18.2.26 WithAlpha() [4/4]

```
Colour VectSharp.Colour.WithAlpha (
            double alpha )
```

Create a new Colour with the same RGB components as the current Colour, but with the specified *alpha* .

Parameters

alpha	The alpha component of the new Colour.

Returns

A Colour struct with the same RGB components as the current Colour and the specified *alpha* .

Definition at line 358 of file Colour.cs.

7.18.3 Member Data Documentation

7.18.3.1 A

```
double VectSharp.Colour.A
```

Alpha component of the colour. Range: [0, 1].

Definition at line 45 of file Colour.cs.

7.18.3.2 a

```
double double VectSharp.Colour.a
```

Definition at line 466 of file Colour.cs.

7.18.3.3 B

```
double VectSharp.Colour.B
```

Blue component of the colour. Range: [0, 1].

Definition at line 40 of file Colour.cs.

7.18.3.4 G

```
double VectSharp.Colour.G
```

Green component of the colour. Range: [0, 1].

Definition at line 35 of file Colour.cs.

7.18.3.5 H

```
double VectSharp.Colour.H
```

Converts a Colour to the HSL colour space.

Returns

A ValueType containing the H, S and L components of the Colour. Each component has range [0, 1].

Definition at line 535 of file Colour.cs.

7.18.3.6 L

```
double VectSharp.Colour.L
```

Converts a Colour to the CIE Lab colour space (under Illuminant D65).

Returns

A ValueType containing the L$*$, a$*$ and b$*$ components of the Colour.

Definition at line 466 of file Colour.cs.

7.18.3.7 R

```
double VectSharp.Colour.R
```

Red component of the colour. Range: [0, 1].

Definition at line 30 of file Colour.cs.

7.18.3.8 S

```
double double VectSharp.Colour.S
```

Definition at line 535 of file Colour.cs.

7.18.3.9 X

```
double VectSharp.Colour.X
```

Converts a Colour to the CIE XYZ colour space.

Returns

A ValueTuple containing the X, Y and Z components of the Colour.

Definition at line 377 of file Colour.cs.

7.18.3.10 Y

```
double double VectSharp.Colour.Y
```

Definition at line 377 of file Colour.cs.

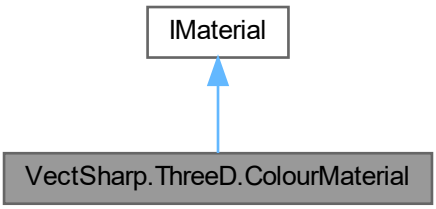
The documentation for this struct was generated from the following files:

- VectSharp/Colour.cs
- VectSharp/StandardColours.cs

7.19 VectSharp.ThreeD.ColourMaterial Class Reference

Represents a material that always has the same colour, regardless of light.

Inheritance diagram for VectSharp.ThreeD.ColourMaterial:



Public Member Functions

- ColourMaterial (Colour colour)

  Creates a new ColourMaterial instance.
- Colour GetColour (Point3D point, NormalizedVector3D surfaceNormal, Camera camera, IList< ILightSource > lights, IList< double > obstructions)

  Obtains the Colour at the specified point.

Parameters

point	*The point whose colour should be determined.*
surfaceNormal	*The normal to the surface at the specified point .*
camera	*The camera being used to render the scene.*
lights	*A list of light sources that are present in the scene.*
obstructions	*A list of values indicating how obstructed each light source is.*

Returns

The Colour of the specified point.

Properties

- Colour Colour `[get]`

  The colour of the material.

7.19.1 Detailed Description

Represents a material that always has the same colour, regardless of light.

Definition at line 48 of file Materials.cs.

7.19.2 Constructor & Destructor Documentation

7.19.2.1 ColourMaterial()

```
VectSharp.ThreeD.ColourMaterial.ColourMaterial (
            Colour colour )
```

Creates a new ColourMaterial instance.

Parameters

colour	The colour of the material.

Definition at line 59 of file Materials.cs.

7.19.3 Member Function Documentation

7.19.3.1 GetColour()

```
Colour VectSharp.ThreeD.ColourMaterial.GetColour (
            Point3D point,
            NormalizedVector3D surfaceNormal,
            Camera camera,
            IList< ILightSource > lights,
            IList< double > obstructions )
```

Obtains the Colour at the specified point.

Parameters

point	The point whose colour should be determined.
surfaceNormal	The normal to the surface at the specified *point* .
camera	The camera being used to render the scene.
lights	A list of light sources that are present in the scene.
obstructions	A list of values indicating how obstructed each light source is.

Returns

The Colour of the specified point.

Implements VectSharp.ThreeD.IMaterial.

Definition at line 65 of file Materials.cs.

7.19.4 Property Documentation

7.19.4.1 Colour

```
Colour VectSharp.ThreeD.ColourMaterial.Colour  [get]
```

The colour of the material.

Definition at line 53 of file Materials.cs.

The documentation for this class was generated from the following file:

- VectSharp.ThreeD/Materials.cs

7.20 VectSharp.Filters.ColourMatrix Class Reference

Represents a colour transformation matrix.

Public Member Functions

- ColourMatrix WithAlpha (double alpha)

  Creates a new ColourMatrix whose alpha coefficients are multiplied by the specified value.
- ColourMatrix (double[,] matrix)

  Creates a new ColourMatrix with the specified coefficients.
- Colour Apply (Colour colour)

  Applies the ColourMatrix to the specified Colour.
- void Apply (ref byte R, ref byte G, ref byte B, ref byte A)

  Applies the ColourMatrix to the specified colour, represented as four bytes, and stores the resulting colour in the same variables as the original RGBA values.
- void Apply (ref byte R, ref byte G, ref byte B)

  Applies the ColourMatrix to the specified colour, represented as three bytes, and stores the resulting colour in the same variables as the original RGB values.
- void Apply (byte R, byte G, byte B, byte A, out byte r, out byte g, out byte b, out byte a)

  Applies the ColourMatrix to the specified colour, represented as four bytes, and stores the resulting colour in the specified output bytes.
- void Apply (byte R, byte G, byte B, out byte r, out byte g, out byte b)

  Applies the ColourMatrix to the specified colour, represented as three bytes, and stores the resulting colour in the specified output bytes.

Static Public Member Functions

- static ColourMatrix ToColour (Colour colour, bool useAlpha=false)

  Creates a ColourMatrix that turns every colour to which it is applied into the specified colour .
- static ColourMatrix LuminanceToColour (Colour colour, bool useAlpha=false)

  Creates a ColourMatrix that turns every colour to which it is applied into a shade of the specified colour . The brightness of the output colour depends on the luminance of the input colour.
- static ColourMatrix LuminanceToAlpha (bool preserveColour=false)

  Creates a ColourMatrix that transforms the alpha value of the colour it is applied to into a value depending on the luminance of the input colour.
- static ColourMatrix operator∗ (ColourMatrix matrix1, ColourMatrix matrix2)

  Concatenates two matrices. The resulting ColourMatrix is equivalent to first applying matrix2 , and then matrix1 .

Static Public Attributes

- static ColourMatrix Identity = new ColourMatrix(new double[,] { { 1, 0, 0, 0, 0 }, { 0, 1, 0, 0, 0 }, { 0, 0, 1, 0, 0 }, { 0, 0, 0, 1, 0 }, { 0, 0, 0, 0, 1 } })

  A ColourMatrix that whose output colour is always the same as the input colour.
- static ColourMatrix GreyScale = new ColourMatrix(new double[,] { { 0.2126, 0.7152, 0.0722, 0, 0 }, { 0.2126, 0.7152, 0.0722, 0, 0 }, { 0.2126, 0.7152, 0.0722, 0, 0 }, { 0, 0, 0, 1, 0 }, { 0, 0, 0, 0, 1 } })

  A ColourMatrix that transforms every colour in a shade of grey with approximately the same luminance.
- static ColourMatrix Pastel = new ColourMatrix(new double[,] { { 0.75, 0.25, 0.25, 0, 0 }, { 0.25, 0.75, 0.25, 0, 0 }, { 0.25, 0.25, 0.75, 0, 0 }, { 0, 0, 0, 1, 0 }, { 0, 0, 0, 0, 1 } })

  A ColourMatrix producing a "pastel" (desaturation) effect.
- static ColourMatrix Inversion = new ColourMatrix(new double[,] { { -1, 0, 0, 0, 1 }, { 0, -1, 0, 0, 1 }, { 0, 0, -1, 0, 1 }, { 0, 0, 0, 1, 0 }, { 0, 0, 0, 0, 1 } })

  A ColourMatrix that inverts every colour, leaving the alpha component intact.
- static ColourMatrix AlphaInversion = new ColourMatrix(new double[,] { { 1, 0, 0, 0, 0 }, { 0, 1, 0, 0, 0 }, { 0, 0, 1, 0, 0 }, { 0, 0, 0, -1, 1 }, { 0, 0, 0, 0, 1 } })

  A ColourMatrix that inverts the alpha component, leaving the other components intact.
- static ColourMatrix InvertedAlphaShift = new ColourMatrix(new double[,] { { 1, 0, 0, -1, 1 }, { 0, 1, 0, -1, 1 }, { 0, 0, 1, -1, 1 }, { 0, 0, 0, 1, 0 }, { 0, 0, 0, 0, 1 } })

  A ColourMatrix that shifts every colour component by an amount corresponding to the inverted alpha value. The alpha component is left intact.

Properties

- double R1 `[get, set]`

  The coefficient relating the R component of the output colour to the R component of the input colour.
- double R2 `[get, set]`

  The coefficient relating the R component of the output colour to the G component of the input colour.
- double R3 `[get, set]`

  The coefficient relating the R component of the output colour to the B component of the input colour.
- double R4 `[get, set]`

  The coefficient relating the R component of the output colour to the A component of the input colour.
- double R5 `[get, set]`

  The bias (translation) applied to the R component of the output colour.
- double G1 `[get, set]`

  The coefficient relating the G component of the output colour to the R component of the input colour.
- double G2 `[get, set]`

  The coefficient relating the G component of the output colour to the G component of the input colour.
- double G3 `[get, set]`

  The coefficient relating the G component of the output colour to the B component of the input colour.
- double G4 `[get, set]`

  The coefficient relating the G component of the output colour to the A component of the input colour.
- double G5 `[get, set]`

  The bias (translation) applied to the R component of the output colour.
- double B1 `[get, set]`

  The coefficient relating the B component of the output colour to the R component of the input colour.
- double B2 `[get, set]`

  The coefficient relating the B component of the output colour to the G component of the input colour.
- double B3 `[get, set]`

  The coefficient relating the B component of the output colour to the B component of the input colour.
- double B4 `[get, set]`

The coefficient relating the B component of the output colour to the A component of the input colour.

- double B5 `[get, set]`

  The bias (translation) applied to the B component of the output colour.

- double A1 `[get, set]`

  The coefficient relating the A component of the output colour to the R component of the input colour.

- double A2 `[get, set]`

  The coefficient relating the A component of the output colour to the G component of the input colour.

- double A3 `[get, set]`

  The coefficient relating the A component of the output colour to the B component of the input colour.

- double A4 `[get, set]`

  The coefficient relating the A component of the output colour to the A component of the input colour.

- double A5 `[get, set]`

  The bias (translation) applied to the A component of the output colour.

- double this[int y, int x] `[get]`

  Gets or sets the requested element of the matrix. Elements of the last row of the matrix can be read, but not set.

7.20.1 Detailed Description

Represents a colour transformation matrix.

Definition at line 26 of file ColourMatrixFilter.cs.

7.20.2 Constructor & Destructor Documentation

7.20.2.1 ColourMatrix()

```
VectSharp.Filters.ColourMatrix.ColourMatrix (
            double matrix[,] )
```

Creates a new ColourMatrix with the specified coefficients.

Parameters

matrix	The coefficients of the ColourMatrix.

Definition at line 454 of file ColourMatrixFilter.cs.

7.20.3 Member Function Documentation

7.20.3.1 Apply() [1/5]

```
void VectSharp.Filters.ColourMatrix.Apply (
            byte R,
            byte G,
            byte B,
            byte A,
            out byte r,
            out byte g,
            out byte b,
            out byte a )
```

Applies the ColourMatrix to the specified colour, represented as four bytes, and stores the resulting colour in the specified output bytes.

Parameters

R	The R component of the input colour.
G	The G component of the input colour.
B	The B component of the input colour.
A	The A component of the input colour.
r	After this method returns, this will contain the R component of the output colour.
g	After this method returns, this will contain the G component of the output colour.
b	After this method returns, this will contain the B component of the output colour.
a	After this method returns, this will contain the A component of the output colour.

Definition at line 538 of file ColourMatrixFilter.cs.

7.20.3.2 Apply() [2/5]

```
void VectSharp.Filters.ColourMatrix.Apply (
            byte R,
            byte G,
            byte B,
            out byte r,
            out byte g,
            out byte b )
```

Applies the ColourMatrix to the specified colour, represented as three bytes, and stores the resulting colour in the specified output bytes.

Parameters

R	The R component of the input colour.
G	The G component of the input colour.
B	The B component of the input colour.
r	After this method returns, this will contain the R component of the output colour.
g	After this method returns, this will contain the G component of the output colour.
b	After this method returns, this will contain the B component of the output colour.

Definition at line 556 of file ColourMatrixFilter.cs.

7.20.3.3 Apply() [3/5]

```
Colour VectSharp.Filters.ColourMatrix.Apply (
            Colour colour )
```

Applies the ColourMatrix to the specified Colour.

Parameters

colour	The Colour to which the ColourMatrix should be applied.

Returns

The result of applying the ColourMatrix to the specified colour.

Definition at line 470 of file ColourMatrixFilter.cs.

7.20.3.4 Apply() [4/5]

```
void VectSharp.Filters.ColourMatrix.Apply (
            ref byte R,
            ref byte G,
            ref byte B )
```

Applies the ColourMatrix to the specified colour, represented as three bytes, and stores the resulting colour in the same variables as the original RGB values.

Parameters

R	The R component of the input colour. After this method returns, this will contain the R component of the output colour.
G	The G component of the input colour. After this method returns, this will contain the G component of the output colour.
B	The B component of the input colour. After this method returns, this will contain the B component of the output colour.

Definition at line 515 of file ColourMatrixFilter.cs.

7.20.3.5 Apply() [5/5]

```
void VectSharp.Filters.ColourMatrix.Apply (
            ref byte R,
```

```
            ref byte G,
            ref byte B,
            ref byte A )
```

Applies the ColourMatrix to the specified colour, represented as four bytes, and stores the resulting colour in the same variables as the original RGBA values.

Parameters

R	The R component of the input colour. After this method returns, this will contain the R component of the output colour.
G	The G component of the input colour. After this method returns, this will contain the G component of the output colour.
B	The B component of the input colour. After this method returns, this will contain the B component of the output colour.
A	The A component of the input colour. After this method returns, this will contain the A component of the output colour.

Definition at line 495 of file ColourMatrixFilter.cs.

7.20.3.6 LuminanceToAlpha()

```
static ColourMatrix VectSharp.Filters.ColourMatrix.LuminanceToAlpha (
            bool preserveColour = false )  [static]
```

Creates a ColourMatrix that transforms the alpha value of the colour it is applied to into a value depending on the luminance of the input colour.

Parameters

preserveColour	If this is `true`, the values of the red, green and blue components of the input colour are preserved in the output colour. If this is false, the output colour will always be black.

Returns

A ColourMatrix that transforms the alpha value of the colour it is applied to into a value depending on the luminance of the input colour.

Definition at line 404 of file ColourMatrixFilter.cs.

7.20.3.7 LuminanceToColour()

```
static ColourMatrix VectSharp.Filters.ColourMatrix.LuminanceToColour (
            Colour colour,
            bool useAlpha = false )  [static]
```

Creates a ColourMatrix that turns every colour to which it is applied into a shade of the specified *colour* . The brightness of the output colour depends on the luminance of the input colour.

Parameters

colour	The colour whose shades will be produced by the ColourMatrix.
useAlpha	If this is `true`, the transformation will also be applied to the alpha channel. If this is false, the alpha value of the input pixels is preserved.

Returns

A ColourMatrix that turns every colour to which it is applied into a shade of the specified *colour* .

Definition at line 387 of file ColourMatrixFilter.cs.

7.20.3.8 operator∗()

```
static ColourMatrix VectSharp.Filters.ColourMatrix.operator* (
            ColourMatrix matrix1,
            ColourMatrix matrix2 )  [static]
```

Concatenates two matrices. The resulting ColourMatrix is equivalent to first applying *matrix2* , and then *matrix1* .

Parameters

matrix1	The matrix that acts second.
matrix2	The matrix that acts first.

Returns

A ColourMatrix equivalent to first applying *matrix2* , and then *matrix1* .

Definition at line 432 of file ColourMatrixFilter.cs.

7.20.3.9 ToColour()

```
static ColourMatrix VectSharp.Filters.ColourMatrix.ToColour (
            Colour colour,
            bool useAlpha = false )  [static]
```

Creates a ColourMatrix that turns every colour to which it is applied into the specified *colour* .

Parameters

colour	The colour that will be produced by the ColourMatrix.
useAlpha	If this is `true`, all output pixels will have the same alpha value as the supplied *colour* . If this is false, the alpha value of the input pixels is preserved.

Returns

A ColourMatrix that turns every colour to which it is applied into the specified *colour* .

Definition at line 369 of file ColourMatrixFilter.cs.

7.20.3.10 WithAlpha()

```
ColourMatrix VectSharp.Filters.ColourMatrix.WithAlpha (
            double alpha )
```

Creates a new ColourMatrix whose alpha coefficients are multiplied by the specified value.

Parameters

alpha	The value that will be used to multiply all the alpha coefficients of the ColourMatrix.

Returns

A new ColourMatrix whose alpha coefficients have been multiplied by the specified value.

Definition at line 421 of file ColourMatrixFilter.cs.

7.20.4 Member Data Documentation

7.20.4.1 AlphaInversion

```
ColourMatrix VectSharp.Filters.ColourMatrix.AlphaInversion = new ColourMatrix(new double[,] {
{ 1, 0, 0, 0, 0 }, { 0, 1, 0, 0, 0 }, { 0, 0, 1, 0, 0 }, { 0, 0, 0, -1, 1 }, { 0, 0, 0, 0, 1 }
})  [static]
```

A ColourMatrix that inverts the alpha component, leaving the other components intact.

Definition at line 356 of file ColourMatrixFilter.cs.

7.20.4.2 GreyScale

```
ColourMatrix VectSharp.Filters.ColourMatrix.GreyScale = new ColourMatrix(new double[,] { {
0.2126, 0.7152, 0.0722, 0, 0 }, { 0.2126, 0.7152, 0.0722, 0, 0 }, { 0.2126, 0.7152, 0.0722, 0,
0 }, { 0, 0, 0, 1, 0 }, { 0, 0, 0, 0, 1 } })  [static]
```

A ColourMatrix that transforms every colour in a shade of grey with approximately the same luminance.

Definition at line 341 of file ColourMatrixFilter.cs.

7.20.4.3 Identity

```
ColourMatrix VectSharp.Filters.ColourMatrix.Identity = new ColourMatrix(new double[,] { { 1, 0, 0, 0, 0 }, { 0, 1, 0, 0, 0 }, { 0, 0, 1, 0, 0 }, { 0, 0, 0, 1, 0 }, { 0, 0, 0, 0, 1 } })
[static]
```

A ColourMatrix that whose output colour is always the same as the input colour.

Definition at line 336 of file ColourMatrixFilter.cs.

7.20.4.4 Inversion

```
ColourMatrix VectSharp.Filters.ColourMatrix.Inversion = new ColourMatrix(new double[,] { { -1, 0, 0, 0, 1 }, { 0, -1, 0, 0, 1 }, { 0, 0, -1, 0, 1 }, { 0, 0, 0, 1, 0 }, { 0, 0, 0, 0, 1 } })
[static]
```

A ColourMatrix that inverts every colour, leaving the alpha component intact.

Definition at line 351 of file ColourMatrixFilter.cs.

7.20.4.5 InvertedAlphaShift

```
ColourMatrix VectSharp.Filters.ColourMatrix.InvertedAlphaShift = new ColourMatrix(new double[,] { { 1, 0, 0, -1, 1 }, { 0, 1, 0, -1, 1 }, { 0, 0, 1, -1, 1 }, { 0, 0, 0, 1, 0 }, { 0, 0, 0, 0, 1 } })  [static]
```

A ColourMatrix that shifts every colour component by an amount corresponding to the inverted alpha value. The alpha component is left intact.

Definition at line 361 of file ColourMatrixFilter.cs.

7.20.4.6 Pastel

```
ColourMatrix VectSharp.Filters.ColourMatrix.Pastel = new ColourMatrix(new double[,] { { 0.75, 0.25, 0.25, 0, 0 }, { 0.25, 0.75, 0.25, 0, 0 }, { 0.25, 0.25, 0.75, 0, 0 }, { 0, 0, 0, 1, 0 }, { 0, 0, 0, 0, 1 } })  [static]
```

A ColourMatrix producing a "pastel" (desaturation) effect.

Definition at line 346 of file ColourMatrixFilter.cs.

7.20.5 Property Documentation

7.20.5.1 A1

```
double VectSharp.Filters.ColourMatrix.A1  [get], [set]
```

The coefficient relating the A component of the output colour to the R component of the input colour.

Definition at line 106 of file ColourMatrixFilter.cs.

7.20.5.2 A2

```
double VectSharp.Filters.ColourMatrix.A2  [get], [set]
```

The coefficient relating the A component of the output colour to the G component of the input colour.

Definition at line 111 of file ColourMatrixFilter.cs.

7.20.5.3 A3

```
double VectSharp.Filters.ColourMatrix.A3  [get], [set]
```

The coefficient relating the A component of the output colour to the B component of the input colour.

Definition at line 116 of file ColourMatrixFilter.cs.

7.20.5.4 A4

```
double VectSharp.Filters.ColourMatrix.A4  [get], [set]
```

The coefficient relating the A component of the output colour to the A component of the input colour.

Definition at line 121 of file ColourMatrixFilter.cs.

7.20.5.5 A5

```
double VectSharp.Filters.ColourMatrix.A5  [get], [set]
```

The bias (translation) applied to the A component of the output colour.

Definition at line 126 of file ColourMatrixFilter.cs.

7.20.5.6 B1

```
double VectSharp.Filters.ColourMatrix.B1  [get], [set]
```

The coefficient relating the B component of the output colour to the R component of the input colour.

Definition at line 81 of file ColourMatrixFilter.cs.

7.20.5.7 B2

```
double VectSharp.Filters.ColourMatrix.B2  [get], [set]
```

The coefficient relating the B component of the output colour to the G component of the input colour.

Definition at line 86 of file ColourMatrixFilter.cs.

7.20.5.8 B3

```
double VectSharp.Filters.ColourMatrix.B3  [get], [set]
```

The coefficient relating the B component of the output colour to the B component of the input colour.

Definition at line 91 of file ColourMatrixFilter.cs.

7.20.5.9 B4

```
double VectSharp.Filters.ColourMatrix.B4  [get], [set]
```

The coefficient relating the B component of the output colour to the A component of the input colour.

Definition at line 96 of file ColourMatrixFilter.cs.

7.20.5.10 B5

```
double VectSharp.Filters.ColourMatrix.B5  [get], [set]
```

The bias (translation) applied to the B component of the output colour.

Definition at line 101 of file ColourMatrixFilter.cs.

7.20.5.11 G1

```
double VectSharp.Filters.ColourMatrix.G1  [get], [set]
```

The coefficient relating the G component of the output colour to the R component of the input colour.

Definition at line 56 of file ColourMatrixFilter.cs.

7.20.5.12 G2

```
double VectSharp.Filters.ColourMatrix.G2  [get], [set]
```

The coefficient relating the G component of the output colour to the G component of the input colour.

Definition at line 61 of file ColourMatrixFilter.cs.

7.20.5.13 G3

```
double VectSharp.Filters.ColourMatrix.G3  [get], [set]
```

The coefficient relating the G component of the output colour to the B component of the input colour.

Definition at line 66 of file ColourMatrixFilter.cs.

7.20.5.14 G4

```
double VectSharp.Filters.ColourMatrix.G4  [get], [set]
```

The coefficient relating the G component of the output colour to the A component of the input colour.

Definition at line 71 of file ColourMatrixFilter.cs.

7.20.5.15 G5

```
double VectSharp.Filters.ColourMatrix.G5  [get], [set]
```

The bias (translation) applied to the R component of the output colour.

Definition at line 76 of file ColourMatrixFilter.cs.

7.20.5.16 R1

```
double VectSharp.Filters.ColourMatrix.R1  [get], [set]
```

The coefficient relating the R component of the output colour to the R component of the input colour.

Definition at line 31 of file ColourMatrixFilter.cs.

7.20.5.17 R2

```
double VectSharp.Filters.ColourMatrix.R2  [get], [set]
```

The coefficient relating the R component of the output colour to the G component of the input colour.

Definition at line 36 of file ColourMatrixFilter.cs.

7.20.5.18 R3

```
double VectSharp.Filters.ColourMatrix.R3  [get], [set]
```

The coefficient relating the R component of the output colour to the B component of the input colour.

Definition at line 41 of file ColourMatrixFilter.cs.

7.20.5.19 R4

```
double VectSharp.Filters.ColourMatrix.R4  [get], [set]
```

The coefficient relating the R component of the output colour to the A component of the input colour.

Definition at line 46 of file ColourMatrixFilter.cs.

7.20.5.20 R5

```
double VectSharp.Filters.ColourMatrix.R5  [get], [set]
```

The bias (translation) applied to the R component of the output colour.

Definition at line 51 of file ColourMatrixFilter.cs.

7.20.5.21 this[int y, int x]

```
double VectSharp.Filters.ColourMatrix.this[int y, int x]  [get]
```

Gets or sets the requested element of the matrix. Elements of the last row of the matrix can be read, but not set.

Parameters

y	The row of the matrix.
x	The column of the matrix.

Returns

The requested element of the matrix.

Exceptions

ArgumentOutOfRangeException	An attempt has been made to access an element out of the bounds of the matrix.

Definition at line 135 of file ColourMatrixFilter.cs.

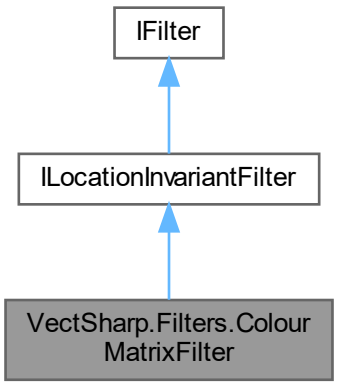
The documentation for this class was generated from the following file:

- VectSharp/Filters/ColourMatrixFilter.cs

7.21 VectSharp.Filters.ColourMatrixFilter Class Reference

Represents a filter that applies a Filters.ColourMatrix to the colours of the image.

Inheritance diagram for VectSharp.Filters.ColourMatrixFilter:



Public Member Functions

- ColourMatrixFilter (ColourMatrix colorMatrix)

  Creates a new ColourMatrixFilter with the specified Filters.ColourMatrix.
- RasterImage Filter (RasterImage image, double scale)

  Applies the filter to a RasterImage.

Parameters

image	*The RasterImage to which the filter will be applied.*
scale	*The scale of the image with respect to the filter.*

Returns

A new RasterImage containing the filtered image. The source image is left unaltered.

Properties

- ColourMatrix ColourMatrix `[get]`

  The Filters.ColourMatrix that is applied by this filter.
- Point TopLeftMargin = new Point() `[get]`

  Determines how much the area of the filter's subject should be expanded on the top-left to accommodate the results of the filter.
- Point BottomRightMargin = new Point() `[get]`

  Determines how much the area of the filter's subject should be expanded on the bottom-right to accommodate the results of the filter.

7.21.1 Detailed Description

Represents a filter that applies a Filters.ColourMatrix to the colours of the image.

Definition at line 567 of file ColourMatrixFilter.cs.

7.21.2 Constructor & Destructor Documentation

7.21.2.1 ColourMatrixFilter()

```
VectSharp.Filters.ColourMatrixFilter.ColourMatrixFilter (
            ColourMatrix colorMatrix )
```

Creates a new ColourMatrixFilter with the specified Filters.ColourMatrix.

Parameters

colorMatrix	The Filters.ColourMatrix that will be applied by the filter.

Definition at line 584 of file ColourMatrixFilter.cs.

7.21.3 Member Function Documentation

7.21.3.1 Filter()

```
RasterImage VectSharp.Filters.ColourMatrixFilter.Filter (
            RasterImage image,
            double scale )
```

Applies the filter to a RasterImage.

Parameters

image	The RasterImage to which the filter will be applied.
scale	The scale of the image with respect to the filter.

Returns

A new RasterImage containing the filtered image. The source *image* is left unaltered.

Implements VectSharp.Filters.ILocationInvariantFilter.

Definition at line 590 of file ColourMatrixFilter.cs.

7.21.4 Property Documentation

7.21.4.1 BottomRightMargin

```
Point VectSharp.Filters.ColourMatrixFilter.BottomRightMargin = new Point()  [get]
```

Determines how much the area of the filter's subject should be expanded on the bottom-right to accommodate the results of the filter.

Implements VectSharp.Filters.IFilter.

Definition at line 578 of file ColourMatrixFilter.cs.

7.21.4.2 ColourMatrix

```
ColourMatrix VectSharp.Filters.ColourMatrixFilter.ColourMatrix  [get]
```

The Filters.ColourMatrix that is applied by this filter.

Definition at line 572 of file ColourMatrixFilter.cs.

7.21.4.3 TopLeftMargin

```
Point VectSharp.Filters.ColourMatrixFilter.TopLeftMargin = new Point()  [get]
```

Determines how much the area of the filter's subject should be expanded on the top-left to accommodate the results of the filter.

Implements VectSharp.Filters.IFilter.

Definition at line 575 of file ColourMatrixFilter.cs.

The documentation for this class was generated from the following file:

- VectSharp/Filters/ColourMatrixFilter.cs

7.22 VectSharp.Colours Class Reference

Standard colours.

  Cornsilk #FFF8DC
- static Colour LemonChiffon = Colour.FromRgb(255, 250, 205)

LemonChiffon #FFFACD

- static Colour FloralWhite = Colour.FromRgb(255, 250, 240)

  FloralWhite #FFFAF0
- static Colour Snow = Colour.FromRgb(255, 250, 250)

  Snow #FFFAFA
- static Colour Yellow = Colour.FromRgb(255, 255, 0)

  Yellow #FFFF00
- static Colour LightYellow = Colour.FromRgb(255, 255, 224)

  LightYellow #FFFFE0
- static Colour Ivory = Colour.FromRgb(255, 255, 240)

  Ivory #FFFFF0
- static Colour White = Colour.FromRgb(255, 255, 255)

  White #FFFFFF

7.22.1 Detailed Description

Standard colours.

Definition at line 182 of file StandardColours.cs.

7.22.2 Member Data Documentation

7.22.2.1 AliceBlue

```
Colour VectSharp.Colours.AliceBlue = Colour.FromRgb(240, 248, 255)  [static]
```

AliceBlue #F0F8FF

Definition at line 599 of file StandardColours.cs.

7.22.2.2 AntiqueWhite

```
Colour VectSharp.Colours.AntiqueWhite = Colour.FromRgb(250, 235, 215)  [static]
```

AntiqueWhite #FAEBD7

Definition at line 639 of file StandardColours.cs.

7.22.2.3 Aqua

```
Colour VectSharp.Colours.Aqua = Colour.FromRgb(0, 255, 255)  [static]
```

Aqua #00FFFF

Definition at line 243 of file StandardColours.cs.

7.22.2.4 Aquamarine

```
Colour VectSharp.Colours.Aquamarine = Colour.FromRgb(127, 255, 212)  [static]
```

Aquamarine #7FFFD4

Definition at line 375 of file StandardColours.cs.

7.22.2.5 Azure

```
Colour VectSharp.Colours.Azure = Colour.FromRgb(240, 255, 255)  [static]
```

Azure #F0FFFF

Definition at line 607 of file StandardColours.cs.

7.22.2.6 Beige

```
Colour VectSharp.Colours.Beige = Colour.FromRgb(245, 245, 220)  [static]
```

Beige #F5F5DC

Definition at line 619 of file StandardColours.cs.

7.22.2.7 Bisque

```
Colour VectSharp.Colours.Bisque = Colour.FromRgb(255, 228, 196)  [static]
```

Bisque #FFE4C4

Definition at line 723 of file StandardColours.cs.

7.22.2.8 Black

```
Colour VectSharp.Colours.Black = Colour.FromRgb(0, 0, 0)  [static]
```

Black #000000

Definition at line 187 of file StandardColours.cs.

7.22.2.9 BlanchedAlmond

```
Colour VectSharp.Colours.BlanchedAlmond = Colour.FromRgb(255, 235, 205)  [static]
```

BlanchedAlmond #FFEBCD

Definition at line 731 of file StandardColours.cs.

7.22.2.10 Blue

```
Colour VectSharp.Colours.Blue = Colour.FromRgb(0, 0, 255)  [static]
```

Blue #0000FF

Definition at line 203 of file StandardColours.cs.

7.22.2.11 BlueViolet

```
Colour VectSharp.Colours.BlueViolet = Colour.FromRgb(138, 43, 226)  [static]
```

BlueViolet #8A2BE2

Definition at line 407 of file StandardColours.cs.

7.22.2.12 Brown

```
Colour VectSharp.Colours.Brown = Colour.FromRgb(165, 42, 42)  [static]
```

Brown #A52A2A

Definition at line 455 of file StandardColours.cs.

7.22.2.13 BurlyWood

```
Colour VectSharp.Colours.BurlyWood = Colour.FromRgb(222, 184, 135)  [static]
```

BurlyWood #DEB887

Definition at line 567 of file StandardColours.cs.

7.22.2.14 CadetBlue

```
Colour VectSharp.Colours.CadetBlue = Colour.FromRgb(95, 158, 160)  [static]
```

CadetBlue #5F9EA0

Definition at line 315 of file StandardColours.cs.

7.22.2.15 Chartreuse

```
Colour VectSharp.Colours.Chartreuse = Colour.FromRgb(127, 255, 0)  [static]
```

Chartreuse #7FFF00

Definition at line 371 of file StandardColours.cs.

7.22.2.16 Chocolate

```
Colour VectSharp.Colours.Chocolate = Colour.FromRgb(210, 105, 30)  [static]
```

Chocolate #D2691E

Definition at line 523 of file StandardColours.cs.

7.22.2.17 Coral

```
Colour VectSharp.Colours.Coral = Colour.FromRgb(255, 127, 80)  [static]
```

Coral #FF7F50

Definition at line 683 of file StandardColours.cs.

7.22.2.18 CornflowerBlue

```
Colour VectSharp.Colours.CornflowerBlue = Colour.FromRgb(100, 149, 237)  [static]
```

CornflowerBlue #6495ED

Definition at line 319 of file StandardColours.cs.

7.22.2.19 Cornsilk

```
Colour VectSharp.Colours.Cornsilk = Colour.FromRgb(255, 248, 220)  [static]
```

Cornsilk #FFF8DC

Definition at line 747 of file StandardColours.cs.

7.22.2.20 Crimson

```
Colour VectSharp.Colours.Crimson = Colour.FromRgb(220, 20, 60)  [static]
```

Crimson #DC143C

Definition at line 555 of file StandardColours.cs.

7.22.2.21 Cyan

```
Colour VectSharp.Colours.Cyan = Colour.FromRgb(0, 255, 255)  [static]
```

Cyan #00FFFF

Definition at line 247 of file StandardColours.cs.

7.22.2.22 DarkBlue

```
Colour VectSharp.Colours.DarkBlue = Colour.FromRgb(0, 0, 139)  [static]
```

DarkBlue #00008B

Definition at line 195 of file StandardColours.cs.

7.22.2.23 DarkCyan

```
Colour VectSharp.Colours.DarkCyan = Colour.FromRgb(0, 139, 139)  [static]
```

DarkCyan #008B8B

Definition at line 219 of file StandardColours.cs.

7.22.2.24 DarkGoldenRod

```
Colour VectSharp.Colours.DarkGoldenRod = Colour.FromRgb(184, 134, 11)  [static]
```

DarkGoldenRod #B8860B

Definition at line 491 of file StandardColours.cs.

7.22.2.25 DarkGray

```
Colour VectSharp.Colours.DarkGray = Colour.FromRgb(169, 169, 169)  [static]
```

DarkGray #A9A9A9

Definition at line 459 of file StandardColours.cs.

7.22.2.26 DarkGreen

```
Colour VectSharp.Colours.DarkGreen = Colour.FromRgb(0, 100, 0)  [static]
```

DarkGreen #006400

Definition at line 207 of file StandardColours.cs.

7.22.2.27 DarkGrey

```
Colour VectSharp.Colours.DarkGrey = Colour.FromRgb(169, 169, 169)  [static]
```

DarkGrey #A9A9A9

Definition at line 463 of file StandardColours.cs.

7.22.2.28 DarkKhaki

```
Colour VectSharp.Colours.DarkKhaki = Colour.FromRgb(189, 183, 107)  [static]
```

DarkKhaki #BDB76B

Definition at line 503 of file StandardColours.cs.

7.22.2.29 DarkMagenta

```
Colour VectSharp.Colours.DarkMagenta = Colour.FromRgb(139, 0, 139)  [static]
```

DarkMagenta #8B008B

Definition at line 415 of file StandardColours.cs.

7.22.2.30 DarkOliveGreen

```
Colour VectSharp.Colours.DarkOliveGreen = Colour.FromRgb(85, 107, 47)  [static]
```

DarkOliveGreen #556B2F

Definition at line 311 of file StandardColours.cs.

7.22.2.31 DarkOrange

```
Colour VectSharp.Colours.DarkOrange = Colour.FromRgb(255, 140, 0)  [static]
```

DarkOrange #FF8C00

Definition at line 687 of file StandardColours.cs.

7.22.2.32 DarkOrchid

```
Colour VectSharp.Colours.DarkOrchid = Colour.FromRgb(153, 50, 204)  [static]
```

DarkOrchid #9932CC

Definition at line 443 of file StandardColours.cs.

7.22.2.33 DarkRed

```
Colour VectSharp.Colours.DarkRed = Colour.FromRgb(139, 0, 0)  [static]
```

DarkRed #8B0000

Definition at line 411 of file StandardColours.cs.

7.22.2.34 DarkSalmon

```
Colour VectSharp.Colours.DarkSalmon = Colour.FromRgb(233, 150, 122)  [static]
```

DarkSalmon #E9967A

Definition at line 579 of file StandardColours.cs.

7.22.2.35 DarkSeaGreen

```
Colour VectSharp.Colours.DarkSeaGreen = Colour.FromRgb(143, 188, 143)  [static]
```

DarkSeaGreen #8FBC8F

Definition at line 423 of file StandardColours.cs.

7.22.2.36 DarkSlateBlue

```
Colour VectSharp.Colours.DarkSlateBlue = Colour.FromRgb(72, 61, 139)  [static]
```

DarkSlateBlue #483D8B

Definition at line 299 of file StandardColours.cs.

7.22.2.37 DarkSlateGray

```
Colour VectSharp.Colours.DarkSlateGray = Colour.FromRgb(47, 79, 79)  [static]
```

DarkSlateGray #2F4F4F

Definition at line 271 of file StandardColours.cs.

7.22.2.38 DarkSlateGrey

```
Colour VectSharp.Colours.DarkSlateGrey = Colour.FromRgb(47, 79, 79)  [static]
```

DarkSlateGrey #2F4F4F

Definition at line 275 of file StandardColours.cs.

7.22.2.39 DarkTurquoise

```
Colour VectSharp.Colours.DarkTurquoise = Colour.FromRgb(0, 206, 209)  [static]
```

DarkTurquoise #00CED1

Definition at line 227 of file StandardColours.cs.

7.22.2.40 DarkViolet

```
Colour VectSharp.Colours.DarkViolet = Colour.FromRgb(148, 0, 211)  [static]
```

DarkViolet #9400D3

Definition at line 435 of file StandardColours.cs.

7.22.2.41 DeepPink

```
Colour VectSharp.Colours.DeepPink = Colour.FromRgb(255, 20, 147)  [static]
```

DeepPink #FF1493

Definition at line 667 of file StandardColours.cs.

7.22.2.42 DeepSkyBlue

```
Colour VectSharp.Colours.DeepSkyBlue = Colour.FromRgb(0, 191, 255)  [static]
```

DeepSkyBlue #00BFFF

Definition at line 223 of file StandardColours.cs.

7.22.2.43 DimGray

```
Colour VectSharp.Colours.DimGray = Colour.FromRgb(105, 105, 105)  [static]
```

DimGray #696969

Definition at line 331 of file StandardColours.cs.

7.22.2.44 DimGrey

```
Colour VectSharp.Colours.DimGrey = Colour.FromRgb(105, 105, 105)  [static]
```

DimGrey #696969

Definition at line 335 of file StandardColours.cs.

7.22.2.45 DodgerBlue

```
Colour VectSharp.Colours.DodgerBlue = Colour.FromRgb(30, 144, 255)  [static]
```

DodgerBlue #1E90FF

Definition at line 255 of file StandardColours.cs.

7.22.2.46 FireBrick

```
Colour VectSharp.Colours.FireBrick = Colour.FromRgb(178, 34, 34)  [static]
```

FireBrick #B22222

Definition at line 487 of file StandardColours.cs.

7.22.2.47 FloralWhite

```
Colour VectSharp.Colours.FloralWhite = Colour.FromRgb(255, 250, 240)  [static]
```

FloralWhite #FFFAF0

Definition at line 755 of file StandardColours.cs.

7.22.2.48 ForestGreen

```
Colour VectSharp.Colours.ForestGreen = Colour.FromRgb(34, 139, 34)  [static]
```

ForestGreen #228B22

Definition at line 263 of file StandardColours.cs.

7.22.2.49 Fuchsia

```
Colour VectSharp.Colours.Fuchsia = Colour.FromRgb(255, 0, 255)  [static]
```

Fuchsia #FF00FF

Definition at line 659 of file StandardColours.cs.

7.22.2.50 Gainsboro

```
Colour VectSharp.Colours.Gainsboro = Colour.FromRgb(220, 220, 220)  [static]
```

Gainsboro #DCDCDC

Definition at line 559 of file StandardColours.cs.

7.22.2.51 GhostWhite

```
Colour VectSharp.Colours.GhostWhite = Colour.FromRgb(248, 248, 255)  [static]
```

GhostWhite #F8F8FF

Definition at line 631 of file StandardColours.cs.

7.22.2.52 Gold

```
Colour VectSharp.Colours.Gold = Colour.FromRgb(255, 215, 0)  [static]
```

Gold #FFD700

Definition at line 707 of file StandardColours.cs.

7.22.2.53 GoldenRod

```
Colour VectSharp.Colours.GoldenRod = Colour.FromRgb(218, 165, 32)  [static]
```

GoldenRod #DAA520

Definition at line 547 of file StandardColours.cs.

7.22.2.54 Gray

```
Colour VectSharp.Colours.Gray = Colour.FromRgb(128, 128, 128)  [static]
```

Gray #808080

Definition at line 391 of file StandardColours.cs.

7.22.2.55 Green

```
Colour VectSharp.Colours.Green = Colour.FromRgb(0, 128, 0)  [static]
```

Green #008000

Definition at line 211 of file StandardColours.cs.

7.22.2.56 GreenYellow

```
Colour VectSharp.Colours.GreenYellow = Colour.FromRgb(173, 255, 47)  [static]
```

GreenYellow #ADFF2F

Definition at line 471 of file StandardColours.cs.

7.22.2.57 Grey

```
Colour VectSharp.Colours.Grey = Colour.FromRgb(128, 128, 128)  [static]
```

Grey #808080

Definition at line 395 of file StandardColours.cs.

7.22.2.58 HoneyDew

```
Colour VectSharp.Colours.HoneyDew = Colour.FromRgb(240, 255, 240)  [static]
```

HoneyDew #F0FFF0

Definition at line 603 of file StandardColours.cs.

7.22.2.59 HotPink

```
Colour VectSharp.Colours.HotPink = Colour.FromRgb(255, 105, 180)  [static]
```

HotPink #FF69B4

Definition at line 679 of file StandardColours.cs.

7.22.2.60 IndianRed

```
Colour VectSharp.Colours.IndianRed = Colour.FromRgb(205, 92, 92)  [static]
```

IndianRed #CD5C5C

Definition at line 515 of file StandardColours.cs.

7.22.2.61 Indigo

```
Colour VectSharp.Colours.Indigo = Colour.FromRgb(75, 0, 130)  [static]
```

Indigo #4B0082

Definition at line 307 of file StandardColours.cs.

7.22.2.62 Ivory

```
Colour VectSharp.Colours.Ivory = Colour.FromRgb(255, 255, 240)  [static]
```

Ivory #FFFFF0

Definition at line 771 of file StandardColours.cs.

7.22.2.63 Khaki

```
Colour VectSharp.Colours.Khaki = Colour.FromRgb(240, 230, 140)  [static]
```

Khaki #F0E68C

Definition at line 595 of file StandardColours.cs.

7.22.2.64 Lavender

```
Colour VectSharp.Colours.Lavender = Colour.FromRgb(230, 230, 250)  [static]
```

Lavender #E6E6FA

Definition at line 575 of file StandardColours.cs.

7.22.2.65 LavenderBlush

```
Colour VectSharp.Colours.LavenderBlush = Colour.FromRgb(255, 240, 245)  [static]

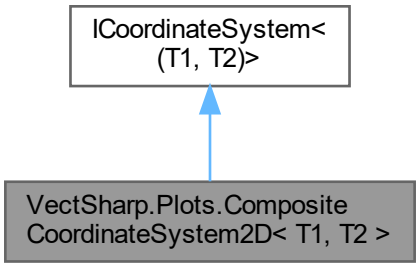
7.23 VectSharp.Plots.CompositeCoordinateSystem2D< T1, T2 > Class Template Reference

Combines two ICoordinateSystem1D<T>s to produce a ICoordinateSystem<T>.

Inheritance diagram for VectSharp.Plots.CompositeCoordinateSystem2D< T1, T2 >:



Public Member Functions

- CompositeCoordinateSystem2D (ICoordinateSystem1D< T1 > coordinateSystemX, ICoordinateSystem1D< T2 > coordinateSystemY)

  Creates a new CompositeCoordinateSystem2D<T1, T2> from two 1-D coordinate system.
- Point ToPlotCoordinates ((T1, T2) dataPoint)

Properties

- ICoordinateSystem1D< T1 > CoordinateSystemX `[get, set]`

  The first coordinate system.
- ICoordinateSystem1D< T2 > CoordinateSystemY `[get, set]`

  The second coordinate system.

7.23.1 Detailed Description

Combines two ICoordinateSystem1D<T>s to produce a ICoordinateSystem<T>.

Template Parameters

T1	The type for the first coordinate system.
T2	The type for the second coordinate system.

Definition at line 1136 of file CoordinateSystems.cs.

7.23.2 Constructor & Destructor Documentation

7.23.2.1 CompositeCoordinateSystem2D()

```
VectSharp.Plots.CompositeCoordinateSystem2D< T1, T2 >.CompositeCoordinateSystem2D (
            ICoordinateSystem1D< T1 > coordinateSystemX,
            ICoordinateSystem1D< T2 > coordinateSystemY )
```

Creates a new CompositeCoordinateSystem2D<T1, T2> from two 1-D coordinate system.

Parameters

coordinateSystemX	The first coordinate system.
coordinateSystemY	The second coordinate system.

Definition at line 1153 of file CoordinateSystems.cs.

7.23.3 Member Function Documentation

7.23.3.1 ToPlotCoordinates()

```
Point VectSharp.Plots.CompositeCoordinateSystem2D< T1, T2 >.ToPlotCoordinates (
            (T1, T2) dataPoint )
```

Definition at line 1160 of file CoordinateSystems.cs.

7.23.4 Property Documentation

7.23.4.1 CoordinateSystemX

```
ICoordinateSystem1D<T1> VectSharp.Plots.CompositeCoordinateSystem2D< T1, T2 >.Coordinate↩
SystemX [get], [set]
```

The first coordinate system.

Definition at line 1141 of file CoordinateSystems.cs.

7.23.4.2 CoordinateSystemY

```
ICoordinateSystem1D<T2> VectSharp.Plots.CompositeCoordinateSystem2D< T1, T2 >.Coordinate↩
SystemY [get], [set]
```

The second coordinate system.

Definition at line 1146 of file CoordinateSystems.cs.

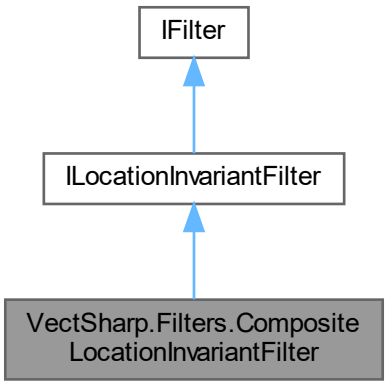
The documentation for this class was generated from the following file:

- VectSharp.Plots/CoordinateSystems.cs

7.24 VectSharp.Filters.CompositeLocationInvariantFilter Class Reference

Represents a filter that corresponds to applying multiple ILocationInvariantFilters one after the other.

Inheritance diagram for VectSharp.Filters.CompositeLocationInvariantFilter:



Public Member Functions

- CompositeLocationInvariantFilter (IEnumerable< ILocationInvariantFilter > filters)

  Creates a new CompositeLocationInvariantFilter with the specified filters.
- CompositeLocationInvariantFilter (params ILocationInvariantFilter[ ] filters)

  Creates a new CompositeLocationInvariantFilter with the specified filters.
- RasterImage Filter (RasterImage image, double scale)

  Applies the filter to a RasterImage.

Parameters

image	*The RasterImage to which the filter will be applied.*
scale	*The scale of the image with respect to the filter.*

Returns

A new RasterImage containing the filtered image. The source image is left unaltered.

Properties

- Point TopLeftMargin `[get]`

  Determines how much the area of the filter's subject should be expanded on the top-left to accommodate the results of the filter.
- Point BottomRightMargin `[get]`

  Determines how much the area of the filter's subject should be expanded on the bottom-right to accommodate the results of the filter.
- ImmutableList< ILocationInvariantFilter > Filters `[get]`

  The filters that are applied by this filter.

7.24.1 Detailed Description

Represents a filter that corresponds to applying multiple ILocationInvariantFilters one after the other.

Definition at line 26 of file CompositeFilter.cs.

7.24.2 Constructor & Destructor Documentation

7.24.2.1 CompositeLocationInvariantFilter() [1/2]

```
VectSharp.Filters.CompositeLocationInvariantFilter.CompositeLocationInvariantFilter (
            IEnumerable< ILocationInvariantFilter > filters )
```

Creates a new CompositeLocationInvariantFilter with the specified filters.

Parameters

filters	The filters that will be applied by the new filter.

Definition at line 43 of file CompositeFilter.cs.

7.24.2.2 CompositeLocationInvariantFilter() [2/2]

```
VectSharp.Filters.CompositeLocationInvariantFilter.CompositeLocationInvariantFilter (
            params ILocationInvariantFilter[] filters )
```

Creates a new CompositeLocationInvariantFilter with the specified filters.

Parameters

filters	The filters that will be applied by the new filter.

Definition at line 70 of file CompositeFilter.cs.

7.24.3 Member Function Documentation

7.24.3.1 Filter()

```
RasterImage VectSharp.Filters.CompositeLocationInvariantFilter.Filter (
            RasterImage image,
            double scale )
```

Applies the filter to a RasterImage.

Parameters

image	The RasterImage to which the filter will be applied.
scale	The scale of the image with respect to the filter.

Returns

A new RasterImage containing the filtered image. The source *image* is left unaltered.

Implements VectSharp.Filters.ILocationInvariantFilter.

Definition at line 91 of file CompositeFilter.cs.

7.24.4 Property Documentation

7.24.4.1 BottomRightMargin

```
Point VectSharp.Filters.CompositeLocationInvariantFilter.BottomRightMargin  [get]
```

Determines how much the area of the filter's subject should be expanded on the bottom-right to accommodate the results of the filter.

Implements VectSharp.Filters.IFilter.

Definition at line 32 of file CompositeFilter.cs.

7.24.4.2 Filters

```
ImmutableList<ILocationInvariantFilter> VectSharp.Filters.CompositeLocationInvariantFilter.↩
Filters  [get]
```

The filters that are applied by this filter.

Definition at line 37 of file CompositeFilter.cs.

7.24.4.3 TopLeftMargin

```
Point VectSharp.Filters.CompositeLocationInvariantFilter.TopLeftMargin  [get]
```

Determines how much the area of the filter's subject should be expanded on the top-left to accommodate the results of the filter.

Implements VectSharp.Filters.IFilter.

Definition at line 29 of file CompositeFilter.cs.

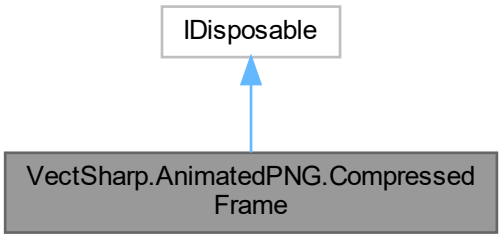
7.25 VectSharp.AnimatedPNG.CompressedFrame Class Reference

Represents an individual frame of a PNG animation.

Inheritance diagram for VectSharp.AnimatedPNG.CompressedFrame:



Public Member Functions

- unsafe CompressedFrame (DisposableIntPtr rawFrameData, int width, int height, bool hasAlpha, double duration)

  Creates a new CompressedFrame from raw pixel data in RGB or RGBA format.
- unsafe CompressedFrame (DisposableIntPtr rawFrameData, DisposableIntPtr otherFrameData, bool isFirstFrame, int width, int height, bool hasAlpha, double duration)

  Creates a new CompressedFrame from raw pixel data in RGB or RGBA format, applying inter-frame compression based on another frame.
- void Dispose ()

Properties

- double Duration `[get]`

  The duration of the frame in milliseconds.

7.25.1 Detailed Description

Represents an individual frame of a PNG animation.

Definition at line 56 of file ImageFormats.cs.

7.25.2 Constructor & Destructor Documentation

7.25.2.1 CompressedFrame() [1/2]

```
unsafe VectSharp.AnimatedPNG.CompressedFrame.CompressedFrame (
            DisposableIntPtr rawFrameData,
            int width,
            int height,
            bool hasAlpha,
            double duration )
```

Creates a new CompressedFrame from raw pixel data in RGB or RGBA format.

Parameters

rawFrameData	A pointer to the raw pixel data for the frame.
width	The width of the image in pixels.
height	The height of the image in pixels.
hasAlpha	If the image data is in RGBA format, set this to `true`; if it is in RGB format, set it to `false`.
duration	The duration of the frame in milliseconds.

Definition at line 76 of file ImageFormats.cs.

7.25.2.2 CompressedFrame() [2/2]

```
unsafe VectSharp.AnimatedPNG.CompressedFrame.CompressedFrame (
            DisposableIntPtr rawFrameData,
            DisposableIntPtr otherFrameData,
            bool isFirstFrame,
            int width,
            int height,
            bool hasAlpha,
            double duration )
```

Creates a new CompressedFrame from raw pixel data in RGB or RGBA format, applying inter-frame compression based on another frame.

Parameters

rawFrameData	A pointer to the raw pixel data for the new frame.
otherFrameData	A pointer to the raw pixel data for the frame to use as a reference. This can either be the first frame in the animation, or the frame immediately preceeding the current frame.
isFirstFrame	If *otherFrameData* is the raw pixel data for the first frame in the animation, set this to `true`; if it is the immediately preceeding frame, set this to `false`.
width	The width of the image in pixels.
height	The height of the image in pixels.
hasAlpha	If the image data is in RGBA format, set this to `true`; if it is in RGB format, set it to `false`.
duration	The duration of the frame in milliseconds.

Definition at line 93 of file ImageFormats.cs.

7.25.3 Member Function Documentation

7.25.3.1 Dispose()

```
void VectSharp.AnimatedPNG.CompressedFrame.Dispose ( )
```

Definition at line 165 of file ImageFormats.cs.

7.25.4 Property Documentation

7.25.4.1 Duration

```
double VectSharp.AnimatedPNG.CompressedFrame.Duration  [get]
```

The duration of the frame in milliseconds.

Definition at line 64 of file ImageFormats.cs.

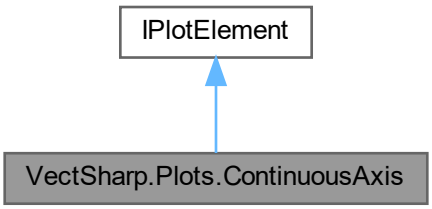
The documentation for this class was generated from the following file:

- VectSharp/ImageFormats.cs

7.26 VectSharp.Plots.ContinuousAxis Class Reference

A plot element that draws an axis line and an arrow.

Inheritance diagram for VectSharp.Plots.ContinuousAxis:



Public Member Functions

- ContinuousAxis (IReadOnlyList< double > startPoint, IReadOnlyList< double > endPoint, IContinuousCoordinateSystem coordinateSystem)

  Creates a new ContinuousAxis instance.
- void Plot (Graphics target)

  Draw the plot element on the specified target Graphics.

Parameters

target	*The Graphics on which to draw.*

Properties

- IReadOnlyList< double > StartPoint `[get, set]`

  The starting point of the axis (i.e., the blunt end of the arrow), expressed in data space coordinates.
- IReadOnlyList< double > EndPoint `[get, set]`

  The ending point of the axis (i.e., the pointy end of the arrow), expressed in data space coordinates.
- double ArrowSize = 3 `[get, set]`

  The size of the arrow at the end of the axis, expressed in plot space coordinates.
- IContinuousCoordinateSystem CoordinateSystem `[get, set]`

  The coordinate system used to transform the points from data space to plot space.
- PlotElementPresentationAttributes PresentationAttributes = new PlotElementPresentationAttributes() `[get, set]`

  Presentation attributes determining the appearance of the axis.
- string Tag `[get, set]`

  A tag to identify the axis in the plot.

7.26.1 Detailed Description

A plot element that draws an axis line and an arrow.

Definition at line 26 of file Axes.cs.

7.26.2 Constructor & Destructor Documentation

7.26.2.1 ContinuousAxis()

```
VectSharp.Plots.ContinuousAxis.ContinuousAxis (
            IReadOnlyList< double > startPoint,
            IReadOnlyList< double > endPoint,
            IContinuousCoordinateSystem coordinateSystem )
```

Creates a new ContinuousAxis instance.

Parameters

startPoint	The starting point of the axis (i.e., the blunt end of the arrow), expressed in data space coordinates.
endPoint	The ending point of the axis (i.e., the pointy end of the arrow), expressed in data space coordinates.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 65 of file Axes.cs.

7.26.3 Member Function Documentation

7.26.3.1 Plot()

```
void VectSharp.Plots.ContinuousAxis.Plot (
            Graphics target )
```

Draw the plot element on the specified *target* Graphics.

Parameters

target	The Graphics on which to draw.

Implements VectSharp.Plots.IPlotElement.

Definition at line 73 of file Axes.cs.

7.26.4 Property Documentation

7.26.4.1 ArrowSize

```
double VectSharp.Plots.ContinuousAxis.ArrowSize = 3  [get], [set]
```

The size of the arrow at the end of the axis, expressed in plot space coordinates.

Definition at line 41 of file Axes.cs.

7.26.4.2 CoordinateSystem

```
IContinuousCoordinateSystem VectSharp.Plots.ContinuousAxis.CoordinateSystem  [get], [set]
```

The coordinate system used to transform the points from data space to plot space.

Implements VectSharp.Plots.IPlotElement.

Definition at line 46 of file Axes.cs.

7.26.4.3 EndPoint

```
IReadOnlyList<double> VectSharp.Plots.ContinuousAxis.EndPoint  [get], [set]
```

The ending point of the axis (i.e., the pointy end of the arrow), expressed in data space coordinates.

Definition at line 36 of file Axes.cs.

7.26.4.4 PresentationAttributes

```
PlotElementPresentationAttributes VectSharp.Plots.ContinuousAxis.PresentationAttributes = new
PlotElementPresentationAttributes()  [get], [set]
```

Presentation attributes determining the appearance of the axis.

Definition at line 52 of file Axes.cs.

7.26.4.5 StartPoint

```
IReadOnlyList<double> VectSharp.Plots.ContinuousAxis.StartPoint  [get], [set]
```

The starting point of the axis (i.e., the blunt end of the arrow), expressed in data space coordinates.

Definition at line 31 of file Axes.cs.

7.26.4.6 Tag

```
string VectSharp.Plots.ContinuousAxis.Tag  [get], [set]
```

A tag to identify the axis in the plot.

Definition at line 57 of file Axes.cs.

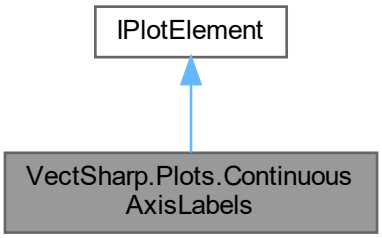
The documentation for this class was generated from the following file:

- VectSharp.Plots/Axes.cs

7.27 VectSharp.Plots.ContinuousAxisLabels Class Reference

A plot element that draws equally spaced labels on an axis.

Inheritance diagram for VectSharp.Plots.ContinuousAxisLabels:



Public Member Functions

- ContinuousAxisLabels (IReadOnlyList< double > startPoint, IReadOnlyList< double > endPoint, IContinuousCoordinateSystem coordinateSystem)

  Create a new ContinuousAxisLabels instance.
- void Plot (Graphics target)

  Draw the plot element on the specified target Graphics.

Parameters

target	*The Graphics on which to draw.*

Properties

- IReadOnlyList< double > StartPoint `[get, set]`

  The starting point of the axis, expressed in data space coordinates.
- IReadOnlyList< double > EndPoint `[get, set]`

  The ending point of the axis, expressed in data space coordinates.
- double IntervalCount = 10 `[get, set]`

  The number of intervals between labels. Note that the number of labels will be one greater than this.
- Func< int, double > Position = _ => 10 `[get, set]`

  The distance of the label anchor from the point on the axis. This should be set to a function accepting an `int` argument representing the index of the label, and return a `double` representing the distance of the label from the axis, in plot space coordinates.
- Func< IReadOnlyList< double >, int, IEnumerable< FormattedText > > TextFormat `[get, set]`

  A function used to determine what text to draw at each label. You should set this to a function accepting two parameters: an IReadOnlyList<T> of `double`s, representing the coordinates of the point the label refers to, and an `int` representing the index of the label. The function should return an IEnumerable<T> of FormattedText objects, representing the text that will be drawn.
- double? Rotation = null `[get, set]`

  The orientation of the label with respect to the horizontal. If this is `null`, the labels will be perpendicular to the axis.
- TextBaselines Baseline = TextBaselines.Middle `[get, set]`

  The baseline for the label anchor.
- TextAnchors Alignment = TextAnchors.Left `[get, set]`

  The alignment for the label anchor.
- IContinuousCoordinateSystem CoordinateSystem `[get, set]`

  The coordinate system used to transform the points from data space to plot space.
- PlotElementPresentationAttributes PresentationAttributes = new PlotElementPresentationAttributes() `[get, set]`

  Presentation attributes determining the appearance of the labels.
- string Tag `[get, set]`

  A tag to identify the labels in the plot.

7.27.1 Detailed Description

A plot element that draws equally spaced labels on an axis.

Definition at line 302 of file Axes.cs.

7.27.2 Constructor & Destructor Documentation

7.27.2.1 ContinuousAxisLabels()

```
VectSharp.Plots.ContinuousAxisLabels.ContinuousAxisLabels (
            IReadOnlyList< double > startPoint,
            IReadOnlyList< double > endPoint,
            IContinuousCoordinateSystem coordinateSystem )
```

Create a new ContinuousAxisLabels instance.

Parameters

startPoint	The starting point of the axis, expressed in data space coordinates.
endPoint	The ending point of the axis, expressed in data space coordinates.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 447 of file Axes.cs.

7.27.3 Member Function Documentation

7.27.3.1 Plot()

```
void VectSharp.Plots.ContinuousAxisLabels.Plot (
            Graphics target )
```

Draw the plot element on the specified *target* Graphics.

Parameters

target	The Graphics on which to draw.

Implements VectSharp.Plots.IPlotElement.

Definition at line 456 of file Axes.cs.

7.27.4 Property Documentation

7.27.4.1 Alignment

```
TextAnchors VectSharp.Plots.ContinuousAxisLabels.Alignment = TextAnchors.Left  [get], [set]
```

The alignment for the label anchor.

Definition at line 423 of file Axes.cs.

7.27.4.2 Baseline

```
TextBaselines VectSharp.Plots.ContinuousAxisLabels.Baseline = TextBaselines.Middle  [get],
[set]
```

The baseline for the label anchor.

Definition at line 418 of file Axes.cs.

7.27.4.3 CoordinateSystem

```
IContinuousCoordinateSystem VectSharp.Plots.ContinuousAxisLabels.CoordinateSystem  [get], [set]
```

The coordinate system used to transform the points from data space to plot space.

Implements VectSharp.Plots.IPlotElement.

Definition at line 428 of file Axes.cs.

7.27.4.4 EndPoint

```
IReadOnlyList<double> VectSharp.Plots.ContinuousAxisLabels.EndPoint  [get], [set]
```

The ending point of the axis, expressed in data space coordinates.

Definition at line 312 of file Axes.cs.

7.27.4.5 IntervalCount

```
double VectSharp.Plots.ContinuousAxisLabels.IntervalCount = 10  [get], [set]
```

The number of intervals between labels. Note that the number of labels will be one greater than this.

Definition at line 317 of file Axes.cs.

7.27.4.6 Position

```
Func<int, double> VectSharp.Plots.ContinuousAxisLabels.Position = _ => 10  [get], [set]
```

The distance of the label anchor from the point on the axis. This should be set to a function accepting an `int` argument representing the index of the label, and return a `double` representing the distance of the label from the axis, in plot space coordinates.

Definition at line 324 of file Axes.cs.

7.27.4.7 PresentationAttributes

```
PlotElementPresentationAttributes VectSharp.Plots.ContinuousAxisLabels.PresentationAttributes
= new PlotElementPresentationAttributes()  [get], [set]
```

Presentation attributes determining the appearance of the labels.

Definition at line 434 of file Axes.cs.

7.27.4.8 Rotation

```
double?  VectSharp.Plots.ContinuousAxisLabels.Rotation = null  [get], [set]
```

The orientation of the label with respect to the horizontal. If this is `null`, the labels will be perpendicular to the axis.

Definition at line 339 of file Axes.cs.

7.27.4.9 StartPoint

```
IReadOnlyList<double> VectSharp.Plots.ContinuousAxisLabels.StartPoint  [get], [set]
```

The starting point of the axis, expressed in data space coordinates.

Definition at line 307 of file Axes.cs.

7.27.4.10 Tag

```
string VectSharp.Plots.ContinuousAxisLabels.Tag  [get], [set]
```

A tag to identify the labels in the plot.

Definition at line 439 of file Axes.cs.

7.27.4.11 TextFormat

```
Func<IReadOnlyList<double>, int, IEnumerable<FormattedText> > VectSharp.Plots.Continuous↩
AxisLabels.TextFormat  [get], [set]
```

A function used to determine what text to draw at each label. You should set this to a function accepting two parameters: an IReadOnlyList<T> of `double`s, representing the coordinates of the point the label refers to, and an `int` representing the index of the label. The function should return an IEnumerable<T> of FormattedText objects, representing the text that will be drawn.

Definition at line 333 of file Axes.cs.

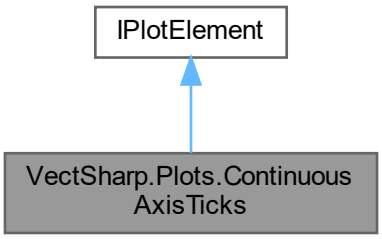
The documentation for this class was generated from the following file:

- VectSharp.Plots/Axes.cs

7.28 VectSharp.Plots.ContinuousAxisTicks Class Reference

A plot element that draws equally spaced ticks on an axis.

Inheritance diagram for VectSharp.Plots.ContinuousAxisTicks:



Public Member Functions

- ContinuousAxisTicks (IReadOnlyList< double > startPoint, IReadOnlyList< double > endPoint, IContinuousCoordinateSystem coordinateSystem)

  Creates a new ContinuousAxisTicks instance.
- void Plot (Graphics target)

  Draw the plot element on the specified target Graphics.

Parameters

target	*The Graphics on which to draw.*

Properties

- IReadOnlyList< double > StartPoint `[get, set]`

  The starting point of the axis, expressed in data space coordinates.
- IReadOnlyList< double > EndPoint `[get, set]`

  The ending point of the axis, expressed in data space coordinates.
- double IntervalCount = 10 `[get, set]`

  The number of intervals between ticks. Note that the number of ticks will be one greater than this.
- Func< int, double > SizeAbove = i => i % 2 == 0 ? 3 : 2 `[get, set]`

  The size of the ticks "above" the axis. What "above" means depends on the orientation of the axis. This should be set to a function accepting an `int` argument representing the index of the tick, and return a `double` representing the size of the tick in plot coordinates.
- Func< int, double > SizeBelow = i => i % 2 == 0 ? 3 : 2 `[get, set]`

  The size of the ticks "below" the axis. What "below" means depends on the orientation of the axis. This should be set to a function accepting an `int` argument representing the index of the tick, and return a `double` representing the size of the tick in plot coordinates.
- IContinuousCoordinateSystem CoordinateSystem `[get, set]`

The coordinate system used to transform the points from data space to plot space.

- PlotElementPresentationAttributes PresentationAttributes = new PlotElementPresentationAttributes() `[get, set]`

  Presentation attributes determining the appearance of the ticks.

- string Tag `[get, set]`

  A tag to identify the ticks in the plot.

7.28.1 Detailed Description

A plot element that draws equally spaced ticks on an axis.

Definition at line 167 of file Axes.cs.

7.28.2 Constructor & Destructor Documentation

7.28.2.1 ContinuousAxisTicks()

```
VectSharp.Plots.ContinuousAxisTicks.ContinuousAxisTicks (
            IReadOnlyList< double > startPoint,
            IReadOnlyList< double > endPoint,
            IContinuousCoordinateSystem coordinateSystem )
```

Creates a new ContinuousAxisTicks instance.

Parameters

startPoint	The starting point of the axis, expressed in data space coordinates.
endPoint	The ending point of the axis, expressed in data space coordinates.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 220 of file Axes.cs.

7.28.3 Member Function Documentation

7.28.3.1 Plot()

```
void VectSharp.Plots.ContinuousAxisTicks.Plot (
            Graphics target )
```

Draw the plot element on the specified *target* Graphics.

Parameters

target	The Graphics on which to draw.

Implements VectSharp.Plots.IPlotElement.

Definition at line 228 of file Axes.cs.

7.28.4 Property Documentation

7.28.4.1 CoordinateSystem

```
IContinuousCoordinateSystem VectSharp.Plots.ContinuousAxisTicks.CoordinateSystem  [get], [set]
```

The coordinate system used to transform the points from data space to plot space.

Implements VectSharp.Plots.IPlotElement.

Definition at line 201 of file Axes.cs.

7.28.4.2 EndPoint

```
IReadOnlyList<double> VectSharp.Plots.ContinuousAxisTicks.EndPoint  [get], [set]
```

The ending point of the axis, expressed in data space coordinates.

Definition at line 177 of file Axes.cs.

7.28.4.3 IntervalCount

```
double VectSharp.Plots.ContinuousAxisTicks.IntervalCount = 10  [get], [set]
```

The number of intervals between ticks. Note that the number of ticks will be one greater than this.

Definition at line 182 of file Axes.cs.

7.28.4.4 PresentationAttributes

```
PlotElementPresentationAttributes VectSharp.Plots.ContinuousAxisTicks.PresentationAttributes =
new PlotElementPresentationAttributes()  [get], [set]
```

Presentation attributes determining the appearance of the ticks.

Definition at line 207 of file Axes.cs.

7.28.4.5 SizeAbove

```
Func<int, double> VectSharp.Plots.ContinuousAxisTicks.SizeAbove = i => i % 2 == 0 ?  3 :  2
[get], [set]
```

The size of the ticks "above" the axis. What "above" means depends on the orientation of the axis. This should be set to a function accepting an `int` argument representing the index of the tick, and return a `double` representing the size of the tick in plot coordinates.

Definition at line 189 of file Axes.cs.

7.28.4.6 SizeBelow

```
Func<int, double> VectSharp.Plots.ContinuousAxisTicks.SizeBelow = i => i % 2 == 0 ?  3 :  2
[get], [set]
```

The size of the ticks "below" the axis. What "below" means depends on the orientation of the axis. This should be set to a function accepting an `int` argument representing the index of the tick, and return a `double` representing the size of the tick in plot coordinates.

Definition at line 196 of file Axes.cs.

7.28.4.7 StartPoint

```
IReadOnlyList<double> VectSharp.Plots.ContinuousAxisTicks.StartPoint  [get], [set]
```

The starting point of the axis, expressed in data space coordinates.

Definition at line 172 of file Axes.cs.

7.28.4.8 Tag

```
string VectSharp.Plots.ContinuousAxisTicks.Tag  [get], [set]
```

A tag to identify the ticks in the plot.

Definition at line 212 of file Axes.cs.

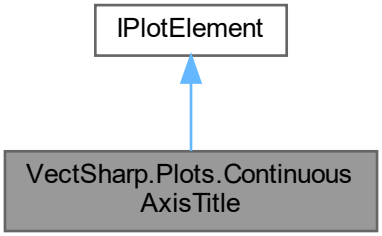
The documentation for this class was generated from the following file:

- VectSharp.Plots/Axes.cs

7.29 VectSharp.Plots.ContinuousAxisTitle Class Reference

A plot element that draws a title for an axis.

Inheritance diagram for VectSharp.Plots.ContinuousAxisTitle:



Public Member Functions

- ContinuousAxisTitle (IEnumerable< FormattedText > title, IReadOnlyList< double > startPoint, IRead↩ OnlyList< double > endPoint, IContinuousCoordinateSystem coordinateSystem)

  Create a new ContinuousAxisTitle instance.
- ContinuousAxisTitle (string title, IReadOnlyList< double > startPoint, IReadOnlyList< double > end↩ Point, IContinuousCoordinateSystem coordinateSystem, PlotElementPresentationAttributes presentation↩ Attributes=null)

  Create a new ContinuousAxisTitle instance.
- void Plot (Graphics target)

  Draw the plot element on the specified target Graphics.

Parameters

target	*The Graphics on which to draw.*

Properties

- IReadOnlyList< double > StartPoint `[get, set]`

  The starting point of the axis, expressed in data space coordinates.
- IReadOnlyList< double > EndPoint `[get, set]`

  The ending point of the axis, expressed in data space coordinates.
- double Position = 30 `[get, set]`

  The distance between the title and the axis, in plot space coordinates.
- IEnumerable< FormattedText > Title `[get, set]`

  The axis title to draw.
- bool FollowAxis = true `[get, set]`

  If the axis is not a straight line (e.g., because the coordinate system is not linear), if this is `true` the title will follow the shape of the axis. If this is `false`, the title will always be drawn on a straight line.
- double? Rotation = null `[get, set]`

  Orientation of the title with respect to the horizontal. If this is `null`, the title is parallel to the axis.
- TextBaselines Baseline = TextBaselines.Middle `[get, set]`

  The baseline for the title anchor.
- TextAnchors Alignment = TextAnchors.Left `[get, set]`

  The alignment for the title anchor.
- IContinuousCoordinateSystem CoordinateSystem `[get, set]`

  The coordinate system used to transform the points from data space to plot space.
- PlotElementPresentationAttributes PresentationAttributes = new PlotElementPresentationAttributes() { Font = new Font(FontFamily.ResolveFontFamily(FontFamily.StandardFontFamilies.HelveticaBold), 14), Stroke = null, Fill = Colours.Black } `[get, set]`

  Presentation attributes determining the appearance of the title.
- string Tag `[get, set]`

  A tag to identify the labels in the plot.

7.29.1 Detailed Description

A plot element that draws a title for an axis.

Definition at line 556 of file Axes.cs.

7.29.2 Constructor & Destructor Documentation

7.29.2.1 ContinuousAxisTitle() [1/2]

```
VectSharp.Plots.ContinuousAxisTitle.ContinuousAxisTitle (
            IEnumerable< FormattedText > title,
            IReadOnlyList< double > startPoint,
            IReadOnlyList< double > endPoint,
            IContinuousCoordinateSystem coordinateSystem )
```

Create a new ContinuousAxisTitle instance.

Parameters

title	The title to draw on the axis.
startPoint	The starting point of the axis, expressed in data space coordinates.
endPoint	The ending point of the axis, expressed in data space coordinates.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 624 of file Axes.cs.

7.29.2.2 ContinuousAxisTitle() [2/2]

```
VectSharp.Plots.ContinuousAxisTitle.ContinuousAxisTitle (
            string title,
            IReadOnlyList< double > startPoint,
            IReadOnlyList< double > endPoint,
            IContinuousCoordinateSystem coordinateSystem,
            PlotElementPresentationAttributes presentationAttributes = null )
```

Create a new ContinuousAxisTitle instance.

Parameters

title	The title to draw on the axis.
startPoint	The starting point of the axis, expressed in data space coordinates.
endPoint	The ending point of the axis, expressed in data space coordinates.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.
presentationAttributes	Presentation attributes determining the appearance of the title.

Definition at line 640 of file Axes.cs.

7.29.3 Member Function Documentation

7.29.3.1 Plot()

```
void VectSharp.Plots.ContinuousAxisTitle.Plot (
            Graphics target )
```

Draw the plot element on the specified *target* Graphics.

Parameters

target	The Graphics on which to draw.

Implements VectSharp.Plots.IPlotElement.

Definition at line 671 of file Axes.cs.

7.29.4 Property Documentation

7.29.4.1 Alignment

```
TextAnchors VectSharp.Plots.ContinuousAxisTitle.Alignment = TextAnchors.Left  [get], [set]
```

The alignment for the title anchor.

Definition at line 599 of file Axes.cs.

7.29.4.2 Baseline

```
TextBaselines VectSharp.Plots.ContinuousAxisTitle.Baseline = TextBaselines.Middle  [get], [set]
```

The baseline for the title anchor.

Definition at line 594 of file Axes.cs.

7.29.4.3 CoordinateSystem

```
IContinuousCoordinateSystem VectSharp.Plots.ContinuousAxisTitle.CoordinateSystem  [get], [set]
```

The coordinate system used to transform the points from data space to plot space.

Implements VectSharp.Plots.IPlotElement.

Definition at line 604 of file Axes.cs.

7.29.4.4 EndPoint

```
IReadOnlyList<double> VectSharp.Plots.ContinuousAxisTitle.EndPoint  [get], [set]
```

The ending point of the axis, expressed in data space coordinates.

Definition at line 566 of file Axes.cs.

7.29.4.5 FollowAxis

```
bool VectSharp.Plots.ContinuousAxisTitle.FollowAxis = true  [get], [set]
```

If the axis is not a straight line (e.g., because the coordinate system is not linear), if this is `true` the title will follow the shape of the axis. If this is `false`, the title will always be drawn on a straight line.

Definition at line 583 of file Axes.cs.

7.29.4.6 Position

```
double VectSharp.Plots.ContinuousAxisTitle.Position = 30  [get], [set]
```

The distance between the title and the axis, in plot space coordinates.

Definition at line 571 of file Axes.cs.

7.29.4.7 PresentationAttributes

```
PlotElementPresentationAttributes VectSharp.Plots.ContinuousAxisTitle.PresentationAttributes =
new PlotElementPresentationAttributes() { Font = new Font(FontFamily.ResolveFontFamily(Font↩
Family.StandardFontFamilies.HelveticaBold), 14), Stroke = null, Fill = Colours.Black }  [get],
[set]
```

Presentation attributes determining the appearance of the title.

Definition at line 610 of file Axes.cs.

7.29.4.8 Rotation

```
double?  VectSharp.Plots.ContinuousAxisTitle.Rotation = null  [get], [set]
```

Orientation of the title with respect to the horizontal. If this is `null`, the title is parallel to the axis.

Definition at line 589 of file Axes.cs.

7.29.4.9 StartPoint

```
IReadOnlyList<double> VectSharp.Plots.ContinuousAxisTitle.StartPoint  [get], [set]
```

The starting point of the axis, expressed in data space coordinates.

Definition at line 561 of file Axes.cs.

7.29.4.10 Tag

```
string VectSharp.Plots.ContinuousAxisTitle.Tag  [get], [set]
```

A tag to identify the labels in the plot.

Definition at line 615 of file Axes.cs.

7.29.4.11 Title

```
IEnumerable<FormattedText> VectSharp.Plots.ContinuousAxisTitle.Title  [get], [set]
```

The axis title to draw.

Definition at line 576 of file Axes.cs.

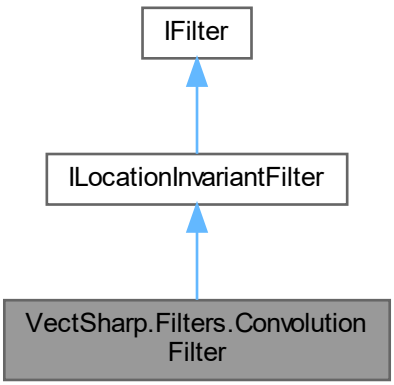
The documentation for this class was generated from the following file:

- VectSharp.Plots/Axes.cs

7.30 VectSharp.Filters.ConvolutionFilter Class Reference

Represents a filter that applies a matrix convolution to the image.

Inheritance diagram for VectSharp.Filters.ConvolutionFilter:



Public Member Functions

- ConvolutionFilter (double[,] kernel, double scale, bool preserveAlpha=true, double normalisation=1, double bias=0)

  Creates a new ConvolutionFilter with the specified parameters.
- virtual RasterImage Filter (RasterImage image, double scale)

  Applies the filter to a RasterImage.

Parameters

image	*The RasterImage to which the filter will be applied.*
scale	*The scale of the image with respect to the filter.*

Returns

A new RasterImage containing the filtered image. The source image is left unaltered.

Properties

- Point TopLeftMargin `[get]`

  Determines how much the area of the filter's subject should be expanded on the top-left to accommodate the results of the filter.
- Point BottomRightMargin `[get]`

  Determines how much the area of the filter's subject should be expanded on the bottom-right to accommodate the results of the filter.
- virtual double[,] Kernel `[get]`

  The kernel of the ConvolutionFilter. The dimensions of this matrix should all be odd numbers. The larger the kernel, the worse the performance.
- virtual double Normalisation = 1 `[get]`

  The normalisation value that is applies to the kernel.
- virtual double Bias = 0 `[get]`

  The bias value that is added to every colour component when the filter is applied.
- virtual double Scale `[get]`

  The scale relating the size of the kernel to graphics units.
- virtual bool PreserveAlpha = true `[get]`

  If this is `true`, the alpha value of the input pixels is preserved. Otherwise, the alpha channel is subject to the same convolution process as the other colour components.

7.30.1 Detailed Description

Represents a filter that applies a matrix convolution to the image.

Definition at line 26 of file ConvolutionFilter.cs.

7.30.2 Constructor & Destructor Documentation

7.30.2.1 ConvolutionFilter()

```
VectSharp.Filters.ConvolutionFilter.ConvolutionFilter (
            double kernel[,],
            double scale,
            bool preserveAlpha = true,
            double normalisation = 1,
            double bias = 0 )
```

Creates a new ConvolutionFilter with the specified parameters.

Parameters

kernel	The kernel of the ConvolutionFilter. The dimensions of this matrix should all be odd numbers. The larger the kernel, the worse the performance.
scale	The scale relating the size of the kernel to graphics units.
preserveAlpha	If this is `true`, the alpha value of the input pixels is preserved. Otherwise, the alpha channel is subject to the same convolution process as the other colour components.
normalisation	The normalisation value that is applies to the kernel.
bias	The bias value that is added to every colour component when the filter is applied.

Exceptions

ArgumentException	This exception is thrown when the kernel dimensions are not odd numbers.

Definition at line 67 of file ConvolutionFilter.cs.

7.30.3 Member Function Documentation

7.30.3.1 Filter()

```
virtual RasterImage VectSharp.Filters.ConvolutionFilter.Filter (
            RasterImage image,
            double scale )  [virtual]
```

Applies the filter to a RasterImage.

Parameters

image	The RasterImage to which the filter will be applied.
scale	The scale of the image with respect to the filter.

Returns

A new RasterImage containing the filtered image. The source *image* is left unaltered.

Implements VectSharp.Filters.ILocationInvariantFilter.

Definition at line 88 of file ConvolutionFilter.cs.

7.30.4 Property Documentation

7.30.4.1 Bias

```
virtual double VectSharp.Filters.ConvolutionFilter.Bias = 0  [get]
```

The bias value that is added to every colour component when the filter is applied.

Definition at line 46 of file ConvolutionFilter.cs.

7.30.4.2 BottomRightMargin

```
Point VectSharp.Filters.ConvolutionFilter.BottomRightMargin  [get]
```

Determines how much the area of the filter's subject should be expanded on the bottom-right to accommodate the results of the filter.

Implements VectSharp.Filters.IFilter.

Definition at line 31 of file ConvolutionFilter.cs.

7.30.4.3 Kernel

```
virtual double [,] VectSharp.Filters.ConvolutionFilter.Kernel  [get]
```

The kernel of the ConvolutionFilter. The dimensions of this matrix should all be odd numbers. The larger the kernel, the worse the performance.

Definition at line 36 of file ConvolutionFilter.cs.

7.30.4.4 Normalisation

```
virtual double VectSharp.Filters.ConvolutionFilter.Normalisation = 1  [get]
```

The normalisation value that is applies to the kernel.

Definition at line 41 of file ConvolutionFilter.cs.

7.30.4.5 PreserveAlpha

```
virtual bool VectSharp.Filters.ConvolutionFilter.PreserveAlpha = true  [get]
```

If this is `true`, the alpha value of the input pixels is preserved. Otherwise, the alpha channel is subject to the same convolution process as the other colour components.

Definition at line 56 of file ConvolutionFilter.cs.

7.30.4.6 Scale

```
virtual double VectSharp.Filters.ConvolutionFilter.Scale  [get]
```

The scale relating the size of the kernel to graphics units.

Definition at line 51 of file ConvolutionFilter.cs.

7.30.4.7 TopLeftMargin

```
Point VectSharp.Filters.ConvolutionFilter.TopLeftMargin  [get]
```

Determines how much the area of the filter's subject should be expanded on the top-left to accommodate the results of the filter.

Implements VectSharp.Filters.IFilter.

Definition at line 29 of file ConvolutionFilter.cs.

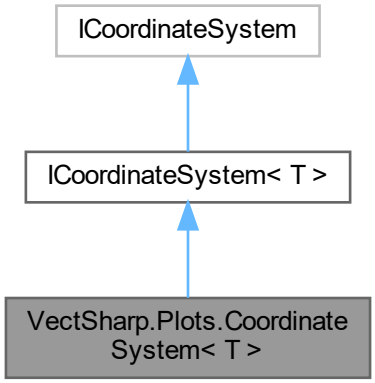
The documentation for this class was generated from the following file:

- VectSharp/Filters/ConvolutionFilter.cs

7.31 VectSharp.Plots.CoordinateSystem< T > Class Template Reference

A coordinate system using a custom method to transform data points.

Inheritance diagram for VectSharp.Plots.CoordinateSystem< T >:



Public Member Functions

- CoordinateSystem (Func< T, Point > coordinateFunction)

  Create a new CoordinateSystem< T > using the specified method.
- Point ToPlotCoordinates (T dataPoint)

  Transform the specified dataPoint into a plot Point.

Parameters

dataPoint	*The data point whose coordinates should be determined.*

Returns

A Point representing the dataPoint in plot space.

Properties

- Func< T, Point > CoordinateFunction `[get, set]`

  The method used to transform the data elements into plot Points.

7.31.1 Detailed Description

A coordinate system using a custom method to transform data points.

Template Parameters

T	The type of data elements.

Definition at line 63 of file CoordinateSystems.cs.

7.31.2 Constructor & Destructor Documentation

7.31.2.1 CoordinateSystem()

```
VectSharp.Plots.CoordinateSystem< T >.CoordinateSystem (
            Func< T, Point > coordinateFunction )
```

Create a new CoordinateSystem<T> using the specified method.

Parameters

coordinateFunction	The method used to transform the data elements into plot Points.

Definition at line 74 of file CoordinateSystems.cs.

7.31.3 Member Function Documentation

7.31.3.1 ToPlotCoordinates()

```
Point VectSharp.Plots.CoordinateSystem< T >.ToPlotCoordinates (
            T dataPoint )
```

Transform the specified *dataPoint* into a plot Point.

Parameters

dataPoint	The data point whose coordinates should be determined.

Returns

A Point representing the *dataPoint* in plot space.

Implements VectSharp.Plots.ICoordinateSystem< T >.

Definition at line 80 of file CoordinateSystems.cs.

7.31.4 Property Documentation

7.31.4.1 CoordinateFunction

```
Func<T, Point> VectSharp.Plots.CoordinateSystem< T >.CoordinateFunction  [get], [set]
```

The method used to transform the data elements into plot Points.

Definition at line 68 of file CoordinateSystems.cs.

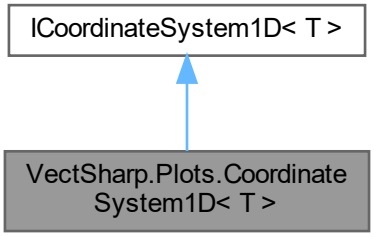
The documentation for this class was generated from the following file:

- VectSharp.Plots/CoordinateSystems.cs

7.32 VectSharp.Plots.CoordinateSystem1D< T > Class Template Reference

A coordinate system using a custom method to transform data points.

Inheritance diagram for VectSharp.Plots.CoordinateSystem1D< T >:



Public Member Functions

- CoordinateSystem1D (Func< T, double > coordinateFunction)

  Creates a new CoordinateSystem1D<T> using the specified coordinateFunction .
- double ToPlotCoordinates (T dataPoint)

  Transform the specified dataPoint into a `double`.

Parameters

dataPoint	*The data point whose coordinates should be determined.*

Returns

A `double` *representing the dataPoint in plot space.*

Properties

- Func< T, double > CoordinateFunction `[get, set]`

  The method used to transform data points.

7.32.1 Detailed Description

A coordinate system using a custom method to transform data points.

Template Parameters

T	The type of data elements.

Definition at line 1055 of file CoordinateSystems.cs.

7.32.2 Constructor & Destructor Documentation

7.32.2.1 CoordinateSystem1D()

```
VectSharp.Plots.CoordinateSystem1D< T >.CoordinateSystem1D (
            Func< T, double > coordinateFunction )
```

Creates a new CoordinateSystem1D<T> using the specified *coordinateFunction* .

Parameters

coordinateFunction	The method used to transform data points.

Definition at line 1066 of file CoordinateSystems.cs.

7.32.3 Member Function Documentation

7.32.3.1 ToPlotCoordinates()

```
double VectSharp.Plots.CoordinateSystem1D< T >.ToPlotCoordinates (
            T dataPoint )
```

Transform the specified *dataPoint* into a `double`.

Parameters

dataPoint	The data point whose coordinates should be determined.

Returns

A `double` representing the *dataPoint* in plot space.

Implements VectSharp.Plots.ICoordinateSystem1D< T >.

Definition at line 1072 of file CoordinateSystems.cs.

7.32.4 Property Documentation

7.32.4.1 CoordinateFunction

```
Func<T, double> VectSharp.Plots.CoordinateSystem1D< T >.CoordinateFunction  [get], [set]
```

The method used to transform data points.

Definition at line 1060 of file CoordinateSystems.cs.

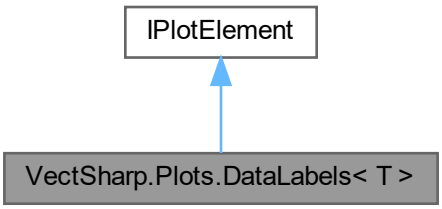
The documentation for this class was generated from the following file:

- VectSharp.Plots/CoordinateSystems.cs

7.33 VectSharp.Plots.DataLabels< T > Class Template Reference

A plot element that draws a text label at each data point.

Inheritance diagram for VectSharp.Plots.DataLabels< T >:



Public Member Functions

- DataLabels (IEnumerable< T > data, ICoordinateSystem< T > coordinateSystem)

  Creates a new DataLabels<T> instance.
- void Plot (Graphics target)

  Draw the plot element on the specified target Graphics.

Parameters

target	*The Graphics on which to draw.*

Properties

- IEnumerable< T > Data `[get, set]`

  The data points at which the labels will be drawn.
- Func< int, T, object > Label `[get, set]`

  A function used to determine the text of the labels to draw. The arguments for this function should be a `int` representing the index of the data point and a T representing the coordinates of the data point. This function should return either an IEnumerable<T> of FormattedText objects, which will be used as-is, or any other kind of object, which will be converted to a `string` to be used in the label.
- Func< int, T, double > Rotation = (i, d) => 0 `[get, set]`

  A function used to determine the orientation of the labels with respect to the horizontal. The arguments for this function should be a `int` representing the index of the data point and a T representing the coordinates of the data point. This function should return a `double` representing the angle with respect to the horizontal at which the label should be drawn.
- Func< int, T, Point > Margin = (i, d) => new Point() `[get, set]`

  A function used to determine the position of the labels with respect to the data points. The arguments for this function should be a `int` representing the index of the data point and a T representing the coordinates of the data point. This function should return a Point defining the amount of space between the data point and the label, in plot coordinates.
- TextBaselines Baseline = TextBaselines.Middle `[get, set]`

  The baseline for the labels.

- TextAnchors Alignment = TextAnchors.Center [get, set]

  The alignment for the labels.
- ICoordinateSystem< T > CoordinateSystem [get, set]

  The coordinate system used to transform the points from data space to plot space.
- PlotElementPresentationAttributes PresentationAttributes = new PlotElementPresentationAttributes() { Stroke = null } [get, set]

  Presentation attributes determining the appearance of the labels.
- string Tag [get, set]

  A tag to identify the labels in the plot.

7.33.1 Detailed Description

A plot element that draws a text label at each data point.

Template Parameters

T	The kind of data describing the data points (generally, IReadOnlyList<double>).

Definition at line 336 of file DataPoints.cs.

7.33.2 Constructor & Destructor Documentation

7.33.2.1 DataLabels()

```
VectSharp.Plots.DataLabels< T >.DataLabels (
            IEnumerable< T > data,
            ICoordinateSystem< T > coordinateSystem )
```

Creates a new DataLabels<T> instance.

Parameters

data	The data points at which the labels will be drawn.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 445 of file DataPoints.cs.

7.33.3 Member Function Documentation

7.33.3.1 Plot()

```
void VectSharp.Plots.DataLabels< T >.Plot (
            Graphics target )
```

Draw the plot element on the specified *target* Graphics.

Parameters

target	The Graphics on which to draw.

Implements VectSharp.Plots.IPlotElement.

Definition at line 465 of file DataPoints.cs.

7.33.4 Property Documentation

7.33.4.1 Alignment

```
TextAnchors VectSharp.Plots.DataLabels< T >.Alignment = TextAnchors.Center  [get], [set]
```

The alignment for the labels.

Definition at line 422 of file DataPoints.cs.

7.33.4.2 Baseline

```
TextBaselines VectSharp.Plots.DataLabels< T >.Baseline = TextBaselines.Middle  [get], [set]
```

The baseline for the labels.

Definition at line 417 of file DataPoints.cs.

7.33.4.3 CoordinateSystem

```
ICoordinateSystem<T> VectSharp.Plots.DataLabels< T >.CoordinateSystem  [get], [set]
```

The coordinate system used to transform the points from data space to plot space.

Implements VectSharp.Plots.IPlotElement.

Definition at line 427 of file DataPoints.cs.

7.33.4.4 Data

```
IEnumerable<T> VectSharp.Plots.DataLabels< T >.Data  [get], [set]
```

The data points at which the labels will be drawn.

Definition at line 341 of file DataPoints.cs.

7.33.4.5 Label

```
Func<int, T, object> VectSharp.Plots.DataLabels< T >.Label  [get], [set]
```

A function used to determine the text of the labels to draw. The arguments for this function should be a `int` representing the index of the data point and a *T* representing the coordinates of the data point. This function should return either an IEnumerable<T> of FormattedText objects, which will be used as-is, or any other kind of object, which will be converted to a `string` to be used in the label.

Definition at line 352 of file DataPoints.cs.

7.33.4.6 Margin

```
Func<int, T, Point> VectSharp.Plots.DataLabels< T >.Margin = (i, d) => new Point()  [get],
[set]
```

A function used to determine the position of the labels with respect to the data points. The arguments for this function should be a `int` representing the index of the data point and a *T* representing the coordinates of the data point. This function should return a Point defining the amount of space between the data point and the label, in plot coordinates.

Definition at line 412 of file DataPoints.cs.

7.33.4.7 PresentationAttributes

```
PlotElementPresentationAttributes VectSharp.Plots.DataLabels< T >.PresentationAttributes = new
PlotElementPresentationAttributes() { Stroke = null }  [get], [set]
```

Presentation attributes determining the appearance of the labels.

Definition at line 433 of file DataPoints.cs.

7.33.4.8 Rotation

```
Func<int, T, double> VectSharp.Plots.DataLabels< T >.Rotation = (i, d) => 0  [get], [set]
```

A function used to determine the orientation of the labels with respect to the horizontal. The arguments for this function should be a `int` representing the index of the data point and a *T* representing the coordinates of the data point. This function should return a `double` representing the angle with respect to the horizontal at which the label should be drawn.

Definition at line 405 of file DataPoints.cs.

7.33.4.9 Tag

```
string VectSharp.Plots.DataLabels< T >.Tag  [get], [set]
```

A tag to identify the labels in the plot.

Definition at line 438 of file DataPoints.cs.

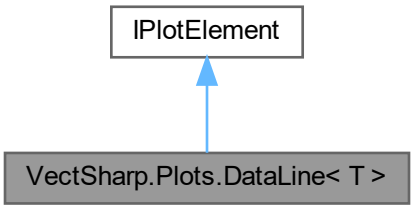
The documentation for this class was generated from the following file:

- VectSharp.Plots/DataPoints.cs

7.34 VectSharp.Plots.DataLine< T > Class Template Reference

A plot element that draws a line passing through a set of points.

Inheritance diagram for VectSharp.Plots.DataLine< T >:



Public Member Functions

- DataLine (IEnumerable< T > data, ICoordinateSystem< T > coordinateSystem)

  Create a new instance of the DataLine< T > class.
- void Plot (Graphics target)

  Draw the plot element on the specified target Graphics.

Parameters

target	*The Graphics on which to draw.*

Properties

- IEnumerable< T > Data `[get, set]`

  The data points through which the line will pass.
- bool Smooth `[get, set]`

  If this is `false`, straight line segments are used to join the data points. If this is `true`, a smooth spline passing through all of them is used instead.
- ICoordinateSystem< T > CoordinateSystem `[get, set]`

  The coordinate system used to transform the points from data space to plot space.
- PlotElementPresentationAttributes PresentationAttributes = new PlotElementPresentationAttributes() `[get, set]`

  Presentation attributes determining the appearance of the line.
- string Tag `[get, set]`

  A tag to identify the labels in the plot.

7.34.1 Detailed Description

A plot element that draws a line passing through a set of points.

Template Parameters

T	The kind of data describing the data points (generally, `IReadOnlyList<double>`).

Definition at line 515 of file DataPoints.cs.

7.34.2 Constructor & Destructor Documentation

7.34.2.1 DataLine()

```
VectSharp.Plots.DataLine< T >.DataLine (
            IEnumerable< T > data,
            ICoordinateSystem< T > coordinateSystem )
```

Create a new instance of the DataLine<T> class.

Parameters

data	The data points through which the line will pass.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 549 of file DataPoints.cs.

7.34.3 Member Function Documentation

7.34.3.1 Plot()

```
void VectSharp.Plots.DataLine< T >.Plot (
            Graphics target )
```

Draw the plot element on the specified *target* Graphics.

Parameters

target	The Graphics on which to draw.

Implements VectSharp.Plots.IPlotElement.

Definition at line 556 of file DataPoints.cs.

7.34.4 Property Documentation

7.34.4.1 CoordinateSystem

```
ICoordinateSystem<T> VectSharp.Plots.DataLine< T >.CoordinateSystem  [get], [set]
```

The coordinate system used to transform the points from data space to plot space.

Implements VectSharp.Plots.IPlotElement.

Definition at line 531 of file DataPoints.cs.

7.34.4.2 Data

```
IEnumerable<T> VectSharp.Plots.DataLine< T >.Data  [get], [set]
```

The data points through which the line will pass.

Definition at line 520 of file DataPoints.cs.

7.34.4.3 PresentationAttributes

```
PlotElementPresentationAttributes VectSharp.Plots.DataLine< T >.PresentationAttributes = new
PlotElementPresentationAttributes()  [get], [set]
```

Presentation attributes determining the appearance of the line.

Definition at line 537 of file DataPoints.cs.

7.34.4.4 Smooth

```
bool VectSharp.Plots.DataLine< T >.Smooth  [get], [set]
```

If this is `false`, straight line segments are used to join the data points. If this is `true`, a smooth spline passing through all of them is used instead.

Definition at line 526 of file DataPoints.cs.

7.34.4.5 Tag

```
string VectSharp.Plots.DataLine< T >.Tag  [get], [set]
```

A tag to identify the labels in the plot.

Definition at line 542 of file DataPoints.cs.

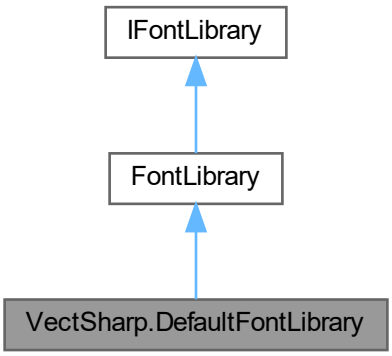
The documentation for this class was generated from the following file:

- VectSharp.Plots/DataPoints.cs

7.35 VectSharp.DefaultFontLibrary Class Reference

A default font library that resolves standard families using the embedded fonts.

Inheritance diagram for VectSharp.DefaultFontLibrary:



Public Member Functions

- override FontFamily ResolveFontFamily (string fontFamily)

  Create a new font family from the specified family name or true type file. If the family name or the true type file are not valid, an exception might be raised.

Parameters

fontFamily	*The name of the font family to create, or the path to a TTF file.*

Returns

If the font family name or the true type file is valid, a FontFamily object corresponding to the specified font family.

- override FontFamily ResolveFontFamily (FontFamily.StandardFontFamilies standardFontFamily)

  Create a new font family from the specified standard font family name.

Parameters

standardFontFamily	*The standard name of the font family.*

Returns

A FontFamily object corresponding to the specified font family.

7.35.1 Detailed Description

A default font library that resolves standard families using the embedded fonts.

Definition at line 461 of file FontLibrary.cs.

7.35.2 Member Function Documentation

7.35.2.1 ResolveFontFamily() [1/2]

```
override FontFamily VectSharp.DefaultFontLibrary.ResolveFontFamily (
            FontFamily.StandardFontFamilies standardFontFamily )  [virtual]
```

Create a new font family from the specified standard font family name.

Parameters

standardFontFamily	The standard name of the font family.

Returns

A FontFamily object corresponding to the specified font family.

Implements VectSharp.FontLibrary.

Definition at line 523 of file FontLibrary.cs.

7.35.2.2 ResolveFontFamily() [2/2]

```
override FontFamily VectSharp.DefaultFontLibrary.ResolveFontFamily (
            string fontFamily )  [virtual]
```

Create a new font family from the specified family name or true type file. If the family name or the true type file are not valid, an exception might be raised.

Parameters

fontFamily	The name of the font family to create, or the path to a TTF file.

Returns

If the font family name or the true type file is valid, a FontFamily object corresponding to the specified font family.

Implements VectSharp.FontLibrary.

Definition at line 464 of file FontLibrary.cs.

The documentation for this class was generated from the following file:

- VectSharp/FontLibrary.cs

7.36 VectSharp.Font.DetailedFontMetrics Class Reference

Represents detailed information about the metrics of a text string when drawn with a certain font.

Properties

- double Width [get]

  Width of the text (measured on the actual glyph outlines).
- double Height [get]

  Height of the text (measured on the actual glyph outlines).
- double LeftSideBearing [get]

  How much the leftmost glyph in the string overhangs the glyph origin on the left. Positive for glyphs that hang past the origin (e.g. italic 'f').
- double RightSideBearing [get]

  How much the rightmost glyph in the string overhangs the glyph end on the right. Positive for glyphs that hang past the end (e.g. italic 'f').
- double Top [get]

  Height of the tallest glyph in the string over the baseline. Always >= 0.
- double Bottom [get]

  Depth of the deepest glyph in the string below the baseline. Always <= 0.
- double AdvanceWidth [get]

  Advance width of the text (excluding any left- or right- side bearing).

7.36.1 Detailed Description

Represents detailed information about the metrics of a text string when drawn with a certain font.

Definition at line 100 of file Font.cs.

7.36.2 Property Documentation

7.36.2.1 AdvanceWidth

```
double VectSharp.Font.DetailedFontMetrics.AdvanceWidth  [get]
```

Advance width of the text (excluding any left- or right- side bearing).

Definition at line 135 of file Font.cs.

7.36.2.2 Bottom

```
double VectSharp.Font.DetailedFontMetrics.Bottom  [get]
```

Depth of the deepest glyph in the string below the baseline. Always <= 0.

Definition at line 130 of file Font.cs.

7.36.2.3 Height

```
double VectSharp.Font.DetailedFontMetrics.Height  [get]
```

Height of the text (measured on the actual glyph outlines).

Definition at line 110 of file Font.cs.

7.36.2.4 LeftSideBearing

```
double VectSharp.Font.DetailedFontMetrics.LeftSideBearing  [get]
```

How much the leftmost glyph in the string overhangs the glyph origin on the left. Positive for glyphs that hang past the origin (e.g. italic 'f').

Definition at line 115 of file Font.cs.

7.36.2.5 RightSideBearing

```
double VectSharp.Font.DetailedFontMetrics.RightSideBearing  [get]
```

How much the rightmost glyph in the string overhangs the glyph end on the right. Positive for glyphs that hang past the end (e.g. italic 'f').

Definition at line 120 of file Font.cs.

7.36.2.6 Top

```
double VectSharp.Font.DetailedFontMetrics.Top  [get]
```

Height of the tallest glyph in the string over the baseline. Always >= 0.

Definition at line 125 of file Font.cs.

7.36.2.7 Width

```
double VectSharp.Font.DetailedFontMetrics.Width  [get]
```

Width of the text (measured on the actual glyph outlines).

Definition at line 105 of file Font.cs.

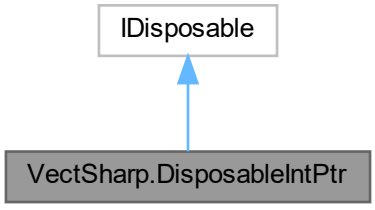
The documentation for this class was generated from the following file:

- VectSharp/Font.cs

7.37 VectSharp.DisposableIntPtr Class Reference

An IDisposable wrapper around an IntPtr that frees the allocated memory when it is disposed.

Inheritance diagram for VectSharp.DisposableIntPtr:



Public Member Functions

- DisposableIntPtr (IntPtr pointer)

  Create a new DisposableIntPtr.
- void Dispose ()

Public Attributes

- readonly IntPtr InternalPointer

  The pointer to the unmanaged memory.

7.37.1 Detailed Description

An IDisposable wrapper around an IntPtr that frees the allocated memory when it is disposed.

Definition at line 53 of file RasterImage.cs.

7.37.2 Constructor & Destructor Documentation

7.37.2.1 DisposableIntPtr()

```
VectSharp.DisposableIntPtr.DisposableIntPtr (
            IntPtr pointer )
```

Create a new DisposableIntPtr.

Parameters

pointer	The pointer that should be freed upon disposing of this object.

Definition at line 64 of file RasterImage.cs.

7.37.3 Member Function Documentation

7.37.3.1 Dispose()

```
void VectSharp.DisposableIntPtr.Dispose ( )
```

Definition at line 88 of file RasterImage.cs.

7.37.4 Member Data Documentation

7.37.4.1 InternalPointer

```
readonly IntPtr VectSharp.DisposableIntPtr.InternalPointer
```

The pointer to the unmanaged memory.

Definition at line 58 of file RasterImage.cs.

The documentation for this class was generated from the following file:

- VectSharp/RasterImage.cs

7.38 VectSharp.Document Class Reference

Represents a collection of pages.

Public Member Functions

- Document ()
  Create a new document.

Public Attributes

- List< Page > Pages = new List<Page>()
  The pages in the document.

7.38.1 Detailed Description

Represents a collection of pages.

Definition at line 27 of file Document.cs.

7.38.2 Constructor & Destructor Documentation

7.38.2.1 Document()

```
VectSharp.Document.Document ( )
```

Create a new document.

Definition at line 38 of file Document.cs.

7.38.3 Member Data Documentation

7.38.3.1 Pages

```
List<Page> VectSharp.Document.Pages = new List<Page>()
```

The pages in the document.

Definition at line 32 of file Document.cs.

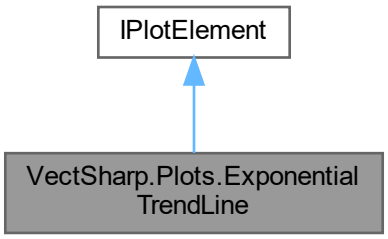
The documentation for this class was generated from the following file:

- VectSharp/Document.cs

7.39 VectSharp.Plots.ExponentialTrendLine Class Reference

A plot element that draws an exponential trendline with equation `y = b * Exp(a * x)`.

Inheritance diagram for VectSharp.Plots.ExponentialTrendLine:



Public Member Functions

- ExponentialTrendLine (double slope, double intercept, double minX, double minY, double maxX, double maxY, IContinuousCoordinateSystem coordinateSystem)

  Create a new ExponentialTrendLine instance, specifying the equation parameters.
- ExponentialTrendLine (IReadOnlyList< IReadOnlyList< double > > data, IContinuousCoordinateSystem coordinateSystem, double? fixedIntercept=null)

  Create a new ExponentialTrendLine instance, determining the equation parameters by running a regression.
- ExponentialTrendLine (IReadOnlyList<(double, double)> data, IContinuousCoordinateSystem coordinate↩System, double? fixedIntercept=null)

  Create a new ExponentialTrendLine instance, determining the equation parameters by running a regression.
- void Plot (Graphics target)

  Draw the plot element on the specified target Graphics.

Parameters

target	*The Graphics on which to draw.*

Properties

- double Slope `[get, set]`

  The slope of the trendline (a).
- double Intercept `[get, set]`

  The intercept of the trendline (b).
- double MinX `[get, set]`

  The minimum X value for which the trendline is plotted.
- double MinY `[get, set]`

  The minimum Y value for which the trendline is plotted.
- double MaxX `[get, set]`

  The maximum X value for which the trendline is plotted.
- double MaxY `[get, set]`

  The maximum Y value for which the trendline is plotted.
- PlotElementPresentationAttributes PresentationAttributes = new PlotElementPresentationAttributes() { LineDash = new LineDash(5, 5, 0), Stroke = Colour.FromRgb(180, 180, 180) } `[get, set]`

  Presentation attributes for the trendline.
- string Tag `[get, set]`

  A tag to identify the trendline in the plot.
- IContinuousCoordinateSystem CoordinateSystem `[get, set]`

  The coordinate system used to transform the points from data space to plot space.

7.39.1 Detailed Description

A plot element that draws an exponential trendline with equation `y = b * Exp(a * x)`.

Definition at line 256 of file Trendlines.cs.

7.39.2 Constructor & Destructor Documentation

7.39.2.1 ExponentialTrendLine() [1/3]

```
VectSharp.Plots.ExponentialTrendLine.ExponentialTrendLine (
            double slope,
            double intercept,
            double minX,
            double minY,
            double maxX,
            double maxY,
            IContinuousCoordinateSystem coordinateSystem )
```

Create a new ExponentialTrendLine instance, specifying the equation parameters.

Parameters

slope	The slope of the trendline (a).
intercept	The intercept of the trendline (b).
minX	The minimum X value for which the trendline is plotted.
minY	The minimum Y value for which the trendline is plotted.
maxX	The maximum X value for which the trendline is plotted.
maxY	The maximum Y value for which the trendline is plotted.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 314 of file Trendlines.cs.

7.39.2.2 ExponentialTrendLine() [2/3]

```
VectSharp.Plots.ExponentialTrendLine.ExponentialTrendLine (
            IReadOnlyList< IReadOnlyList< double > > data,
            IContinuousCoordinateSystem coordinateSystem,
            double?  fixedIntercept = null )
```

Create a new ExponentialTrendLine instance, determining the equation parameters by running a regression.

Parameters

data	The data that will be used to determine the equation parameters.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.
fixedIntercept	If this is `null`, the intercept (b) is determined during the regression; otherwise, it is fixed to the specified value.

Definition at line 331 of file Trendlines.cs.

7.39.2.3 ExponentialTrendLine() [3/3]

```
VectSharp.Plots.ExponentialTrendLine.ExponentialTrendLine (
            IReadOnlyList<(double, double)> data,
            IContinuousCoordinateSystem coordinateSystem,
            double?  fixedIntercept = null )
```

Create a new ExponentialTrendLine instance, determining the equation parameters by running a regression.

Parameters

data	The data that will be used to determine the equation parameters.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.
fixedIntercept	If this is `null`, the intercept (b) is determined during the regression; otherwise, it is fixed to the specified value.

Definition at line 385 of file Trendlines.cs.

7.39.3 Member Function Documentation

7.39.3.1 Plot()

```
void VectSharp.Plots.ExponentialTrendLine.Plot (
            Graphics target )
```

Draw the plot element on the specified *target* Graphics.

Parameters

target	The Graphics on which to draw.

Implements VectSharp.Plots.IPlotElement.

Definition at line 388 of file Trendlines.cs.

7.39.4 Property Documentation

7.39.4.1 CoordinateSystem

```
IContinuousCoordinateSystem VectSharp.Plots.ExponentialTrendLine.CoordinateSystem  [get], [set]
```

The coordinate system used to transform the points from data space to plot space.

Implements VectSharp.Plots.IPlotElement.

Definition at line 301 of file Trendlines.cs.

7.39.4.2 Intercept

```
double VectSharp.Plots.ExponentialTrendLine.Intercept  [get], [set]
```

The intercept of the trendline (b).

Definition at line 266 of file Trendlines.cs.

7.39.4.3 MaxX

```
double VectSharp.Plots.ExponentialTrendLine.MaxX  [get], [set]
```

The maximum X value for which the trendline is plotted.

Definition at line 281 of file Trendlines.cs.

7.39.4.4 MaxY

```
double VectSharp.Plots.ExponentialTrendLine.MaxY  [get], [set]
```

The maximum Y value for which the trendline is plotted.

Definition at line 286 of file Trendlines.cs.

7.39.4.5 MinX

```
double VectSharp.Plots.ExponentialTrendLine.MinX  [get], [set]
```

The minimum X value for which the trendline is plotted.

Definition at line 271 of file Trendlines.cs.

7.39.4.6 MinY

```
double VectSharp.Plots.ExponentialTrendLine.MinY  [get], [set]
```

The minimum Y value for which the trendline is plotted.

Definition at line 276 of file Trendlines.cs.

7.39.4.7 PresentationAttributes

```
PlotElementPresentationAttributes VectSharp.Plots.ExponentialTrendLine.PresentationAttributes
= new PlotElementPresentationAttributes() { LineDash = new LineDash(5, 5, 0), Stroke = Colour.FromRgb(180,
180, 180) }  [get], [set]
```

Presentation attributes for the trendline.

Definition at line 291 of file Trendlines.cs.

7.39.4.8 Slope

```
double VectSharp.Plots.ExponentialTrendLine.Slope  [get], [set]
```

The slope of the trendline (a).

Definition at line 261 of file Trendlines.cs.

7.39.4.9 Tag

```
string VectSharp.Plots.ExponentialTrendLine.Tag  [get], [set]
```

A tag to identify the trendline in the plot.

Definition at line 296 of file Trendlines.cs.

The documentation for this class was generated from the following file:

- VectSharp.Plots/Trendlines.cs

7.40 VectSharp.Canvas.FilterOption Class Reference

Determines how and whether image filters are rasterised.

Public Types

- enum FilterOperations
  Defines whether image filters should be rasterised or not.

Public Member Functions

- FilterOption (FilterOperations operation, double rasterisationResolution, bool rasterisationResolutionRelative)
  Create a new FilterOption object.

Static Public Attributes

- static FilterOption Default = new FilterOption(FilterOperations.RasteriseAllWithSkia, 1, true)
  The default options for image filter rasterisation.

Properties

- FilterOperations Operation = FilterOperations.RasteriseAllWithSkia [get]

  Defines whether image filters should be rasterised or not.
- double RasterisationResolution = 1 [get]

  The resolution that will be used to rasterise image filters. Depending on the value of RasterisationResolutionRelative, this can either be an absolute resolution (i.e. a size in pixel), or a scale factor that is applied to the image size in graphics units.
- bool RasterisationResolutionRelative = true [get]

  Determines whether the value of RasterisationResolution is absolute (i.e. a size in pixel), or relative (i.e. a scale factor that is applied to the image size in graphics units).

7.40.1 Detailed Description

Determines how and whether image filters are rasterised.

Definition at line 1480 of file SKRenderContext.cs.

7.40.2 Member Enumeration Documentation

7.40.2.1 FilterOperations

```
enum VectSharp.Canvas.FilterOption.FilterOperations
```

Defines whether image filters should be rasterised or not.

Definition at line 1485 of file SKRenderContext.cs.

7.40.3 Constructor & Destructor Documentation

7.40.3.1 FilterOption()

```
VectSharp.Canvas.FilterOption.FilterOption (
            FilterOperations operation,
            double rasterisationResolution,
            bool rasterisationResolutionRelative )
```

Create a new FilterOption object.

Parameters

operation	Defines whether image filters should be rasterised or not.
rasterisationResolution	The resolution that will be used to rasterise image filters. Depending on the value of RasterisationResolutionRelative, this can either be an absolute resolution (i.e. a size in pixel), or a scale factor that is applied to the image size in graphics units.
rasterisationResolutionRelative	Determines whether the value of RasterisationResolution is absolute (i.e. a size in pixel), or relative (i.e. a scale factor that is applied to the image size in graphics units).

Definition at line 1534 of file SKRenderContext.cs.

7.40.4 Member Data Documentation

7.40.4.1 Default

```
FilterOption VectSharp.Canvas.FilterOption.Default = new FilterOption(FilterOperations.↩
RasteriseAllWithSkia, 1, true)  [static]
```

The default options for image filter rasterisation.

Definition at line 1526 of file SKRenderContext.cs.

7.40.5 Property Documentation

7.40.5.1 Operation

```
FilterOperations VectSharp.Canvas.FilterOption.Operation = FilterOperations.RasteriseAllWith↩
Skia  [get]
```

Defines whether image filters should be rasterised or not.

Definition at line 1511 of file SKRenderContext.cs.

7.40.5.2 RasterisationResolution

```
double VectSharp.Canvas.FilterOption.RasterisationResolution = 1  [get]
```

The resolution that will be used to rasterise image filters. Depending on the value of RasterisationResolutionRelative, this can either be an absolute resolution (i.e. a size in pixel), or a scale factor that is applied to the image size in graphics units.

Definition at line 1516 of file SKRenderContext.cs.

7.40.5.3 RasterisationResolutionRelative

```
bool VectSharp.Canvas.FilterOption.RasterisationResolutionRelative = true  [get]
```

Determines whether the value of RasterisationResolution is absolute (i.e. a size in pixel), or relative (i.e. a scale factor that is applied to the image size in graphics units).

Definition at line 1521 of file SKRenderContext.cs.

The documentation for this class was generated from the following file:

- VectSharp.Canvas/SKRenderContext.cs

7.41 VectSharp.PDF.PDFContextInterpreter.FilterOption Class Reference

Determines how and whether image filters are rasterised.

Public Types

- enum FilterOperations

  Defines whether image filters should be rasterised or not.

Public Member Functions

- FilterOption (FilterOperations operation, double rasterisationResolution, bool rasterisationResolutionRelative)

  Create a new FilterOption object.

Static Public Attributes

- static FilterOption Default = new FilterOption(FilterOperations.RasteriseAll, 1, true)

  The default options for image filter rasterisation.

Properties

- FilterOperations Operation = FilterOperations.RasteriseAll [get]

  Defines whether image filters should be rasterised or not.
- double RasterisationResolution = 1 [get]

  The resolution that will be used to rasterise image filters. Depending on the value of RasterisationResolutionRelative, this can either be an absolute resolution (i.e. a size in pixel), or a scale factor that is applied to the image size in graphics units.
- bool RasterisationResolutionRelative = true [get]

  Determines whether the value of RasterisationResolution is absolute (i.e. a size in pixel), or relative (i.e. a scale factor that is applied to the image size in graphics units).

7.41.1 Detailed Description

Determines how and whether image filters are rasterised.

Definition at line 1142 of file PDFContext.cs.

7.41.2 Member Enumeration Documentation

7.41.2.1 FilterOperations

```
enum VectSharp.PDF.PDFContextInterpreter.FilterOption.FilterOperations
```

Defines whether image filters should be rasterised or not.

Definition at line 1147 of file PDFContext.cs.

7.41.3 Constructor & Destructor Documentation

7.41.3.1 FilterOption()

```
VectSharp.PDF.PDFContextInterpreter.FilterOption.FilterOption (
            FilterOperations operation,
            double rasterisationResolution,
            bool rasterisationResolutionRelative )
```

Create a new FilterOption object.

Parameters

operation	Defines whether image filters should be rasterised or not.
rasterisationResolution	The resolution that will be used to rasterise image filters. Depending on the value of RasterisationResolutionRelative, this can either be an absolute resolution (i.e. a size in pixel), or a scale factor that is applied to the image size in graphics units.
rasterisationResolutionRelative	Determines whether the value of RasterisationResolution is absolute (i.e. a size in pixel), or relative (i.e. a scale factor that is applied to the image size in graphics units).

Definition at line 1191 of file PDFContext.cs.

7.41.4 Member Data Documentation

7.41.4.1 Default

```
FilterOption VectSharp.PDF.PDFContextInterpreter.FilterOption.Default = new FilterOption(Filter↩
Operations.RasteriseAll, 1, true)  [static]
```

The default options for image filter rasterisation.

Definition at line 1183 of file PDFContext.cs.

7.41.5 Property Documentation

7.41.5.1 Operation

```
FilterOperations VectSharp.PDF.PDFContextInterpreter.FilterOption.Operation = FilterOperations.↩
RasteriseAll  [get]
```

Defines whether image filters should be rasterised or not.

Definition at line 1168 of file PDFContext.cs.

7.41.5.2 RasterisationResolution

```
double VectSharp.PDF.PDFContextInterpreter.FilterOption.RasterisationResolution = 1  [get]
```

The resolution that will be used to rasterise image filters. Depending on the value of RasterisationResolutionRelative, this can either be an absolute resolution (i.e. a size in pixel), or a scale factor that is applied to the image size in graphics units.

Definition at line 1173 of file PDFContext.cs.

7.41.5.3 RasterisationResolutionRelative

```
bool VectSharp.PDF.PDFContextInterpreter.FilterOption.RasterisationResolutionRelative = true
[get]
```

Determines whether the value of RasterisationResolution is absolute (i.e. a size in pixel), or relative (i.e. a scale factor that is applied to the image size in graphics units).

Definition at line 1178 of file PDFContext.cs.

The documentation for this class was generated from the following file:

- VectSharp.PDF/PDFContext.cs

7.42 VectSharp.SVG.SVGContextInterpreter.FilterOption Class Reference

Determines how and whether image filters are rasterised.

Public Types

- enum FilterOperations

  Defines whether image filters should be rasterised or not.

Public Member Functions

- FilterOption (FilterOperations operation, double rasterisationResolution, bool rasterisationResolutionRelative)

  Create a new FilterOption object.

Static Public Attributes

- static FilterOption Default = new FilterOption(FilterOperations.RasteriseIfNecessary, 1, true)

  The default options for image filter rasterisation.

Properties

- FilterOperations Operation = FilterOperations.RasteriseIfNecessary `[get]`

  Defines whether image filters should be rasterised or not.
- double RasterisationResolution = 1 `[get]`

  The resolution that will be used to rasterise image filters. Depending on the value of RasterisationResolutionRelative, this can either be an absolute resolution (i.e. a size in pixel), or a scale factor that is applied to the image size in graphics units.
- bool RasterisationResolutionRelative = true `[get]`

  Determines whether the value of RasterisationResolution is absolute (i.e. a size in pixel), or relative (i.e. a scale factor that is applied to the image size in graphics units).

7.42.1 Detailed Description

Determines how and whether image filters are rasterised.

Definition at line 2280 of file SVGContext.cs.

7.42.2 Member Enumeration Documentation

7.42.2.1 FilterOperations

`enum VectSharp.SVG.SVGContextInterpreter.FilterOption.FilterOperations`

Defines whether image filters should be rasterised or not.

Definition at line 2285 of file SVGContext.cs.

7.42.3 Constructor & Destructor Documentation

7.42.3.1 FilterOption()

```
VectSharp.SVG.SVGContextInterpreter.FilterOption.FilterOption (
            FilterOperations operation,
            double rasterisationResolution,
            bool rasterisationResolutionRelative )
```

Create a new FilterOption object.

Parameters

operation	Defines whether image filters should be rasterised or not.
rasterisationResolution	The resolution that will be used to rasterise image filters. Depending on the value of RasterisationResolutionRelative, this can either be an absolute resolution (i.e. a size in pixel), or a scale factor that is applied to the image size in graphics units.
rasterisationResolutionRelative	Determines whether the value of RasterisationResolution is absolute (i.e. a size in pixel), or relative (i.e. a scale factor that is applied to the image size in graphics units).

Definition at line 2344 of file SVGContext.cs.

7.42.4 Member Data Documentation

7.42.4.1 Default

```
FilterOption VectSharp.SVG.SVGContextInterpreter.FilterOption.Default = new FilterOption(Filter↩
Operations.RasteriseIfNecessary, 1, true)  [static]
```

The default options for image filter rasterisation.

Definition at line 2336 of file SVGContext.cs.

7.42.5 Property Documentation

7.42.5.1 Operation

```
FilterOperations VectSharp.SVG.SVGContextInterpreter.FilterOption.Operation = FilterOperations.↩
RasteriseIfNecessary  [get]
```

Defines whether image filters should be rasterised or not.

Definition at line 2321 of file SVGContext.cs.

7.42.5.2 RasterisationResolution

```
double VectSharp.SVG.SVGContextInterpreter.FilterOption.RasterisationResolution = 1  [get]
```

The resolution that will be used to rasterise image filters. Depending on the value of RasterisationResolutionRelative, this can either be an absolute resolution (i.e. a size in pixel), or a scale factor that is applied to the image size in graphics units.

Definition at line 2326 of file SVGContext.cs.

7.42.5.3 RasterisationResolutionRelative

```
bool VectSharp.SVG.SVGContextInterpreter.FilterOption.RasterisationResolutionRelative = true
[get]
```

Determines whether the value of RasterisationResolution is absolute (i.e. a size in pixel), or relative (i.e. a scale factor that is applied to the image size in graphics units).

Definition at line 2331 of file SVGContext.cs.

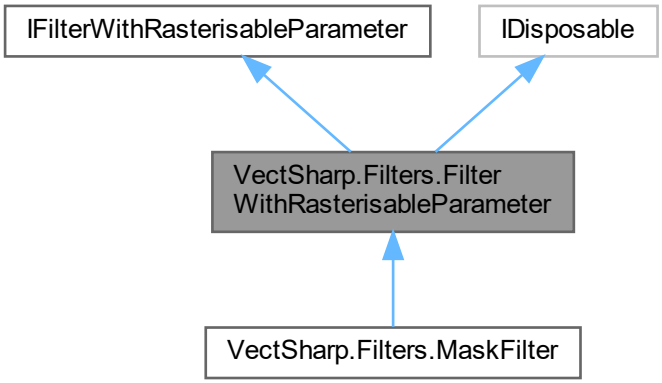
The documentation for this class was generated from the following file:

- VectSharp.SVG/SVGContext.cs

7.43 VectSharp.Filters.FilterWithRasterisableParameter Class Reference

Represents a filter with a parameter that needs to be rasterised at the same resolution as the subject image prior to applying the filter.

Inheritance diagram for VectSharp.Filters.FilterWithRasterisableParameter:



Public Member Functions

- virtual void RasteriseParameter (Func< Graphics, Rectangle, double, bool, RasterImage > rasterisation↩ Method, double scale)

  Rasterises the filter's parameter at the specified scale, using the specified rasterisation method.

Parameters

rasterisationMethod	*The method used to rasterise the image. The first argument of this method is the Graphics to be rasterised, the second is a Rectangle representing the region to rasterise, the third is a double representing the scale, and the third is a boolean value indicating whether the resulting RasterImage should be interpolated.*
scale	*The scale factor at which the parameter is rasterised.*

- void Dispose ()

7.43.1 Detailed Description

Represents a filter with a parameter that needs to be rasterised at the same resolution as the subject image prior to applying the filter.

Definition at line 86 of file Filters.cs.

7.43.2 Member Function Documentation

7.43.2.1 Dispose()

```
void VectSharp.Filters.FilterWithRasterisableParameter.Dispose ( )
```

Definition at line 187 of file Filters.cs.

7.43.2.2 RasteriseParameter()

```
virtual void VectSharp.Filters.FilterWithRasterisableParameter.RasteriseParameter (
            Func< Graphics, Rectangle, double, bool, RasterImage > rasterisationMethod,
            double scale )  [virtual]
```

Rasterises the filter's parameter at the specified scale, using the specified rasterisation method.

Parameters

rasterisationMethod	The method used to rasterise the image. The first argument of this method is the Graphics to be rasterised, the second is a Rectangle representing the region to rasterise, the third is a double representing the scale, and the third is a boolean value indicating whether the resulting RasterImage should be interpolated.
scale	The scale factor at which the parameter is rasterised.

Implements VectSharp.Filters.IFilterWithRasterisableParameter.

Definition at line 135 of file Filters.cs.

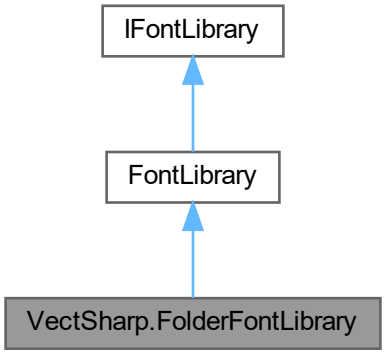
The documentation for this class was generated from the following file:

- VectSharp/Filters/Filters.cs

7.44 VectSharp.FolderFontLibrary Class Reference

A font library that resolves fonts from a folder containing TrueType files.

Inheritance diagram for VectSharp.FolderFontLibrary:



Public Member Functions

- FolderFontLibrary (string folderPath)

  Creates a new FolderFontLibrary using fonts from the specified path, and using the FontFamily.DefaultFontLibrary to resolve the standard font families.
- FolderFontLibrary (string folderPath, IFontLibrary standardFontLibrary)

  Creates a new FolderFontLibrary using fonts from the specified path, and using the specified IFontLibrary to resolve the standard font families.
- override FontFamily ResolveFontFamily (string fontFamily)

  Create a new font family from the specified family name or true type file. If the family name or the true type file are not valid, an exception might be raised.

Parameters

fontFamily	*The name of the font family to create, or the path to a TTF file.*

Returns

If the font family name or the true type file is valid, a FontFamily object corresponding to the specified font family.

- override FontFamily ResolveFontFamily (FontFamily.StandardFontFamilies standardFontFamily)

  Create a new font family from the specified standard font family name.

Parameters

standardFontFamily	*The standard name of the font family.*

Returns

A FontFamily object corresponding to the specified font family.

7.44.1 Detailed Description

A font library that resolves fonts from a folder containing TrueType files.

Definition at line 555 of file FontLibrary.cs.

7.44.2 Constructor & Destructor Documentation

7.44.2.1 FolderFontLibrary() [1/2]

```
VectSharp.FolderFontLibrary.FolderFontLibrary (
            string folderPath )
```

Creates a new FolderFontLibrary using fonts from the specified path, and using the FontFamily.DefaultFontLibrary to resolve the standard font families.

Parameters

folderPath	The path to the folder containing the TrueType files.

Definition at line 565 of file FontLibrary.cs.

7.44.2.2 FolderFontLibrary() [2/2]

```
VectSharp.FolderFontLibrary.FolderFontLibrary (
            string folderPath,
            IFontLibrary standardFontLibrary )
```

Creates a new FolderFontLibrary using fonts from the specified path, and using the specified IFontLibrary to resolve the standard font families.

Parameters

folderPath	The path to the folder containing the TrueType files.
standardFontLibrary	The IFontLibrary to use when resolving standard font families.

Definition at line 572 of file FontLibrary.cs.

7.44.3 Member Function Documentation

7.44.3.1 ResolveFontFamily() [1/2]

```
override FontFamily VectSharp.FolderFontLibrary.ResolveFontFamily (
            FontFamily.StandardFontFamilies standardFontFamily )  [virtual]
```

Create a new font family from the specified standard font family name.

Parameters

standardFontFamily	The standard name of the font family.

Returns

A FontFamily object corresponding to the specified font family.

Implements VectSharp.FontLibrary.

Definition at line 636 of file FontLibrary.cs.

7.44.3.2 ResolveFontFamily() [2/2]

```
override FontFamily VectSharp.FolderFontLibrary.ResolveFontFamily (
            string fontFamily )  [virtual]
```

Create a new font family from the specified family name or true type file. If the family name or the true type file are not valid, an exception might be raised.

Parameters

fontFamily	The name of the font family to create, or the path to a TTF file.

Returns

If the font family name or the true type file is valid, a FontFamily object corresponding to the specified font family.

Implements VectSharp.FontLibrary.

Definition at line 604 of file FontLibrary.cs.

The documentation for this class was generated from the following file:

- VectSharp/FontLibrary.cs

7.45 VectSharp.Font Class Reference

Represents a typeface with a specific size.

Classes

- class DetailedFontMetrics

  Represents detailed information about the metrics of a text string when drawn with a certain font.
- class FontUnderline

  Represents options to underline text.

Public Member Functions

- Font (FontFamily fontFamily, double fontSize)

  Create a new Font object, given the base typeface and the font size.
- Font (FontFamily fontFamily, double fontSize, bool underlined)

  Create a new Font object, given the base typeface, the font size, and a boolean value determining whether text using this font should be underlined.
- Font (FontFamily fontFamily, double fontSize, FontUnderline underline)

  Create a new Font object, given the base typeface, the font size, and an object describing the underline properties of text drawn using this font.
- Size MeasureText (string text)

  Measure the size of a text string when typeset with this font.
- DetailedFontMetrics MeasureTextAdvanced (string text)

  Measure all the metrics of a text string when typeset with this font.

Static Public Attributes

- static bool EnableKerning = true

  Determines whether text kerning is enabled. Note that, even when this is set to `false`, text kerning will be applied on some platforms. For the best consistency, leave this set to `true`.

Properties

- double FontSize `[get]`

  Font size, in graphics units.
- FontFamily FontFamily `[get]`

  Font typeface.
- double Ascent `[get]`

  Maximum height over the baseline of the usual glyphs in the font (there may be glyphs taller than this). Always >= 0.
- double WinAscent `[get]`

  Height above the baseline for a clipping region (Windows ascent). Always >= 0.
- double Descent `[get]`

  Maximum depth below the baseline of the usual glyphs in the font (there may be glyphs deeper than this). Always <= 0.
- double YMax `[get]`

  Absolute maximum height over the baseline of the glyphs in the font. Always >= 0.
- double YMin `[get]`

  Absolute maximum depth below the baseline of the glyphs in the font. Always <= 0.
- FontUnderline Underline `[get]`

  Determines the underline style of text drawn using this font. If this is `null`, the text is not underlined.

7.45.1 Detailed Description

Represents a typeface with a specific size.

Definition at line 27 of file Font.cs.

7.45.2 Constructor & Destructor Documentation

7.45.2.1 Font() [1/3]

```
VectSharp.Font.Font (
            FontFamily fontFamily,
            double fontSize )
```

Create a new Font object, given the base typeface and the font size.

Parameters

fontFamily	Base typeface. See FontFamily.
fontSize	The font size, in graphics units.

Definition at line 164 of file Font.cs.

7.45.2.2 Font() [2/3]

```
VectSharp.Font.Font (
            FontFamily fontFamily,
            double fontSize,
            bool underlined )
```

Create a new Font object, given the base typeface, the font size, and a boolean value determining whether text using this font should be underlined.

Parameters

fontFamily	Base typeface. See FontFamily.
fontSize	The font size, in graphics units.
underlined	A boolean value determining whether text drawn using this font should be underlined. The appearance of the underline can be tweaked by changing the properties of the Underline property after the font has been created.

Definition at line 176 of file Font.cs.

7.45.2.3 Font() [3/3]

```
VectSharp.Font.Font (
            FontFamily fontFamily,
            double fontSize,
            FontUnderline underline )
```

Create a new Font object, given the base typeface, the font size, and an object describing the underline properties of text drawn using this font.

Parameters

fontFamily	Base typeface. See FontFamily.
fontSize	The font size, in graphics units.
underline	A FontUnderline object describing the underline properties of text drawn using this font.

Definition at line 193 of file Font.cs.

7.45.3 Member Function Documentation

7.45.3.1 MeasureText()

```
Size VectSharp.Font.MeasureText (
            string text )
```

Measure the size of a text string when typeset with this font.

Parameters

text	The string to measure.

Returns

A Size object representing the width and height of the text.

Definition at line 300 of file Font.cs.

7.45.3.2 MeasureTextAdvanced()

```
DetailedFontMetrics VectSharp.Font.MeasureTextAdvanced (
            string text )
```

Measure all the metrics of a text string when typeset with this font.

Parameters

text	The string to measure.

Returns

A DetailedFontMetrics object representing the metrics of the text.

Definition at line 357 of file Font.cs.

7.45.4 Member Data Documentation

7.45.4.1 EnableKerning

```
bool VectSharp.Font.EnableKerning = true  [static]
```

Determines whether text kerning is enabled. Note that, even when this is set to `false`, text kerning will be applied on some platforms. For the best consistency, leave this set to `true`.

Definition at line 32 of file Font.cs.

7.45.5 Property Documentation

7.45.5.1 Ascent

```
double VectSharp.Font.Ascent  [get]
```

Maximum height over the baseline of the usual glyphs in the font (there may be glyphs taller than this). Always >= 0.

Definition at line 203 of file Font.cs.

7.45.5.2 Descent

```
double VectSharp.Font.Descent  [get]
```

Maximum depth below the baseline of the usual glyphs in the font (there may be glyphs deeper than this). Always <= 0.

Definition at line 239 of file Font.cs.

7.45.5.3 FontFamily

```
FontFamily VectSharp.Font.FontFamily  [get]
```

Font typeface.

Definition at line 157 of file Font.cs.

7.45.5.4 FontSize

```
double VectSharp.Font.FontSize [get]
```

Font size, in graphics units.

Definition at line 152 of file Font.cs.

7.45.5.5 Underline

```
FontUnderline VectSharp.Font.Underline [get]
```

Determines the underline style of text drawn using this font. If this is `null`, the text is not underlined.

Definition at line 293 of file Font.cs.

7.45.5.6 WinAscent

```
double VectSharp.Font.WinAscent [get]
```

Height above the baseline for a clipping region (Windows ascent). Always >= 0.

Definition at line 221 of file Font.cs.

7.45.5.7 YMax

```
double VectSharp.Font.YMax [get]
```

Absolute maximum height over the baseline of the glyphs in the font. Always >= 0.

Definition at line 257 of file Font.cs.

7.45.5.8 YMin

```
double VectSharp.Font.YMin [get]
```

Absolute maximum depth below the baseline of the glyphs in the font. Always <= 0.

Definition at line 275 of file Font.cs.

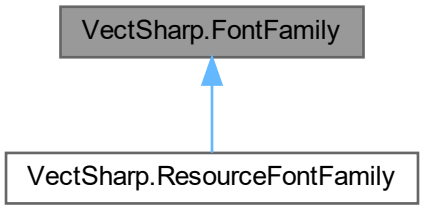
The documentation for this class was generated from the following file:

- VectSharp/Font.cs

7.46 VectSharp.FontFamily Class Reference

Represents a typeface.

Inheritance diagram for VectSharp.FontFamily:



Public Types

- enum StandardFontFamilies

  The 14 standard font families.

Public Member Functions

- FontFamily (string fileName)

  Create a new FontFamily.
- FontFamily (Stream ttfStream)

  Create a new FontFamily.
- FontFamily (TrueTypeFile ttf)

  Create a new FontFamily.
- FontFamily (StandardFontFamilies standardFontFamily)

  Create a new standard FontFamily.

Static Public Member Functions

- static FontFamily ResolveFontFamily (string fontFamily)

  Create a new font family from the specified family name or true type file. If the family name or the true type file are not valid, an exception might be raised. Equivalent to DefaultFontLibrary.ResolveFontFamily.
- static FontFamily ResolveFontFamily (StandardFontFamilies standardFontFamily)

  Create a new font family from the specified standard font family name. Equivalent to DefaultFontLibrary.ResolveFontFamily.
- static FontFamily ResolveFontFamily (string fontFamily, params string[ ] fallback)

  Create a new font family from the specified family name or true type file. If the family name or the true type file are not valid, try to instantiate the font family using the fallback . If none of the fallback family names or true type files are valid, an exception might be raised. Equivalent to DefaultFontLibrary.ResolveFontFamily.
- static FontFamily ResolveFontFamily (string fontFamily, StandardFontFamilies finalFallback, params string[ ] fallback)

  Create a new font family from the specified family name or true type file. If the family name or the true type file are not valid, try to instantiate the font family using the fallback . If none of the fallback family names or true type files are valid, instantiate a standard font family using the finalFallback . Equivalent to DefaultFontLibrary.ResolveFontFamily.

Static Public Attributes

- static string[ ] StandardFamilies = new string[ ] { "Times-Roman", "Times-Bold", "Times-Italic", "Times-Bold↩ Italic", "Helvetica", "Helvetica-Bold", "Helvetica-Oblique", "Helvetica-BoldOblique", "Courier", "Courier-Bold", "Courier-Oblique", "Courier-BoldOblique", "Symbol", "ZapfDingbats" }

  The names of the 14 standard families that are guaranteed to be displayed correctly.
- static string[ ] StandardFontFamilyResources

  The names of the resource streams pointing to the included TrueType font files for each of the standard 14 font families.

Properties

- static IFontLibrary DefaultFontLibrary = new DefaultFontLibrary() `[get, set]`

  The default font library used to resolve font family names.
- bool IsStandardFamily `[get]`

  Whether this is one of the 14 standard font families or not.
- string FileName `[get]`

  Full path to the TrueType font file for this font family (or, if this is a standard font family, name of the font family).
- string FamilyName `[get]`

  Name of the font family, including any variantes.
- TrueTypeFile TrueTypeFile `[get]`

  Parsed TrueType font file for this font family. See also:
  See also

  VectSharp.TrueTypeFile

  .
- bool IsBold `[get]`

  Whether this font is bold or not. This is set based on the information included in the OS/2 table of the TrueType file.
- bool IsItalic `[get]`

  Whether this font is italic or oblique or not. This is set based on the information included in the OS/2 table of the TrueType file.
- bool IsOblique `[get]`

  Whether this font is oblique or not. This is set based on the information included in the OS/2 table of the TrueType file.

7.46.1 Detailed Description

Represents a typeface.

Definition at line 420 of file Font.cs.

7.46.2 Member Enumeration Documentation

7.46.2.1 StandardFontFamilies

`enum VectSharp.FontFamily.StandardFontFamilies`

The 14 standard font families.

Definition at line 499 of file Font.cs.

7.46.3 Constructor & Destructor Documentation

7.46.3.1 FontFamily() [1/4]

```
VectSharp.FontFamily.FontFamily (
            string fileName )
```

Create a new FontFamily.

Parameters

fileName	The full path to the TrueType font file for this font family or the name of a standard font family.

Definition at line 608 of file Font.cs.

7.46.3.2 FontFamily() [2/4]

```
VectSharp.FontFamily.FontFamily (
            Stream ttfStream )
```

Create a new FontFamily.

Parameters

ttfStream	A stream containing a file in TTF format.

Definition at line 633 of file Font.cs.

7.46.3.3 FontFamily() [3/4]

```
VectSharp.FontFamily.FontFamily (
            TrueTypeFile ttf )
```

Create a new FontFamily.

Parameters

ttf	A font file in TTF format.

Definition at line 653 of file Font.cs.

7.46.3.4 FontFamily() [4/4]

```
VectSharp.FontFamily.FontFamily (
            StandardFontFamilies standardFontFamily )
```

Create a new standard FontFamily.

Parameters

standardFontFamily	The standard font family.

Definition at line 674 of file Font.cs.

7.46.4 Member Function Documentation

7.46.4.1 ResolveFontFamily() [1/4]

```
static FontFamily VectSharp.FontFamily.ResolveFontFamily (
            StandardFontFamilies standardFontFamily )  [static]
```

Create a new font family from the specified standard font family name. Equivalent to DefaultFontLibrary.ResolveFontFamily.

Parameters

standardFontFamily	The standard name of the font family.

Returns

A FontFamily object corresponding to the specified font family.

7.46.4.2 ResolveFontFamily() [2/4]

```
static FontFamily VectSharp.FontFamily.ResolveFontFamily (
            string fontFamily )  [static]
```

Create a new font family from the specified family name or true type file. If the family name or the true type file are not valid, an exception might be raised. Equivalent to DefaultFontLibrary.ResolveFontFamily.

Parameters

fontFamily	The name of the font family to create, or the path to a TTF file.

Returns

If the font family name or the true type file is valid, a FontFamily object corresponding to the specified font family.

7.46.4.3 ResolveFontFamily() [3/4]

```
static FontFamily VectSharp.FontFamily.ResolveFontFamily (
            string fontFamily,
            params string[] fallback )  [static]
```

Create a new font family from the specified family name or true type file. If the family name or the true type file are not valid, try to instantiate the font family using the *fallback* . If none of the fallback family names or true type files are valid, an exception might be raised. Equivalent to DefaultFontLibrary.ResolveFontFamily.

Parameters

fontFamily	The name of the font family to create, or the path to a TTF file.
fallback	Names of additional font families or TTF files, which will be tried if the first *fontFamily* is not valid.

Returns

A FontFamily object corresponding to the first of the specified font families that is valid.

7.46.4.4 ResolveFontFamily() [4/4]

```
static FontFamily VectSharp.FontFamily.ResolveFontFamily (
            string fontFamily,
            StandardFontFamilies finalFallback,
            params string[] fallback )  [static]
```

Create a new font family from the specified family name or true type file. If the family name or the true type file are not valid, try to instantiate the font family using the *fallback* . If none of the fallback family names or true type files are valid, instantiate a standard font family using the *finalFallback* . Equivalent to DefaultFontLibrary.ResolveFontFamily.

Parameters

fontFamily	The name of the font family to create, or the path to a TTF file.
fallback	Names of additional font families or TTF files, which will be tried if the first *fontFamily* is not valid.
finalFallback	The standard name of the font family that will be used if none of the fallback families are valid.

Returns

A FontFamily object corresponding to the first of the specified font families that is valid.

7.46.5 Member Data Documentation

7.46.5.1 StandardFamilies

```
string [] VectSharp.FontFamily.StandardFamilies = new string[] { "Times-Roman", "Times-Bold",
"Times-Italic", "Times-BoldItalic", "Helvetica", "Helvetica-Bold", "Helvetica-Oblique", "Helvetica-Bold↩
Oblique", "Courier", "Courier-Bold", "Courier-Oblique", "Courier-BoldOblique", "Symbol", "Zapf↩
Dingbats" }  [static]
```

The names of the 14 standard families that are guaranteed to be displayed correctly.

Definition at line 478 of file Font.cs.

7.46.5.2 StandardFontFamilyResources

```
string [] VectSharp.FontFamily.StandardFontFamilyResources  [static]
```

Initial value:

```
= new string[]
        {
            "VectSharp.StandardFonts.Tinos-Regular.ttf", "VectSharp.StandardFonts.Tinos-Bold.ttf",
      "VectSharp.StandardFonts.Tinos-Italic.ttf", "VectSharp.StandardFonts.Tinos-BoldItalic.ttf",
            "VectSharp.StandardFonts.Arimo-Regular.ttf", "VectSharp.StandardFonts.Arimo-Bold.ttf",
      "VectSharp.StandardFonts.Arimo-Italic.ttf", "VectSharp.StandardFonts.Arimo-BoldItalic.ttf",
            "VectSharp.StandardFonts.Cousine-Regular.ttf", "VectSharp.StandardFonts.Cousine-Bold.ttf",
      "VectSharp.StandardFonts.Cousine-Italic.ttf", "VectSharp.StandardFonts.Cousine-BoldItalic.ttf",
            "VectSharp.StandardFonts.SymbolNeu_GB.ttf", "VectSharp.StandardFonts.Levibats-Regular_GB.ttf"
        }
```

The names of the resource streams pointing to the included TrueType font files for each of the standard 14 font families.

Definition at line 483 of file Font.cs.

7.46.6 Property Documentation

7.46.6.1 DefaultFontLibrary

```
IFontLibrary VectSharp.FontFamily.DefaultFontLibrary = new DefaultFontLibrary()  [static],
[get], [set]
```

The default font library used to resolve font family names.

Definition at line 425 of file Font.cs.

7.46.6.2 FamilyName

```
string VectSharp.FontFamily.FamilyName  [get]
```

Name of the font family, including any variantes.

Definition at line 580 of file Font.cs.

7.46.6.3 FileName

```
string VectSharp.FontFamily.FileName  [get]
```

Full path to the TrueType font file for this font family (or, if this is a standard font family, name of the font family).

Definition at line 575 of file Font.cs.

7.46.6.4 IsBold

```
bool VectSharp.FontFamily.IsBold  [get]
```

Whether this font is bold or not. This is set based on the information included in the OS/2 table of the TrueType file.

Definition at line 591 of file Font.cs.

7.46.6.5 IsItalic

```
bool VectSharp.FontFamily.IsItalic  [get]
```

Whether this font is italic or oblique or not. This is set based on the information included in the OS/2 table of the TrueType file.

Definition at line 596 of file Font.cs.

7.46.6.6 IsOblique

```
bool VectSharp.FontFamily.IsOblique  [get]
```

Whether this font is oblique or not. This is set based on the information included in the OS/2 table of the TrueType file.

Definition at line 601 of file Font.cs.

7.46.6.7 IsStandardFamily

```
bool VectSharp.FontFamily.IsStandardFamily  [get]
```

Whether this is one of the 14 standard font families or not.

Definition at line 494 of file Font.cs.

7.46.6.8 TrueTypeFile

```
TrueTypeFile VectSharp.FontFamily.TrueTypeFile  [get]
```

Parsed TrueType font file for this font family. See also:

See also

VectSharp.TrueTypeFile

.

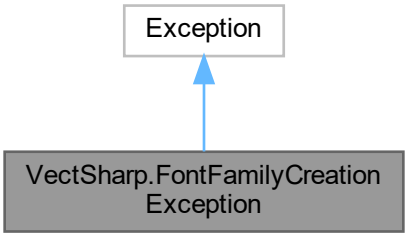
The documentation for this class was generated from the following file:

- VectSharp/Font.cs

7.47 VectSharp.FontFamilyCreationException Class Reference

An exception that occurs while creating a FontFamily.

Inheritance diagram for VectSharp.FontFamilyCreationException:



Public Member Functions

- FontFamilyCreationException (string fontFamily)

  Create a new FontFamilyCreationException instance.

Properties

- string FontFamily `[get]`

  The name of the font family that was being created.

7.47.1 Detailed Description

An exception that occurs while creating a FontFamily.

Definition at line 441 of file FontLibrary.cs.

7.47.2 Constructor & Destructor Documentation

7.47.2.1 FontFamilyCreationException()

```
VectSharp.FontFamilyCreationException.FontFamilyCreationException (
            string fontFamily )
```

Create a new FontFamilyCreationException instance.

Parameters

fontFamily	The name of the font family that was being created.

Definition at line 452 of file FontLibrary.cs.

7.47.3 Property Documentation

7.47.3.1 FontFamily

```
string VectSharp.FontFamilyCreationException.FontFamily [get]
```

The name of the font family that was being created.

Definition at line 446 of file FontLibrary.cs.

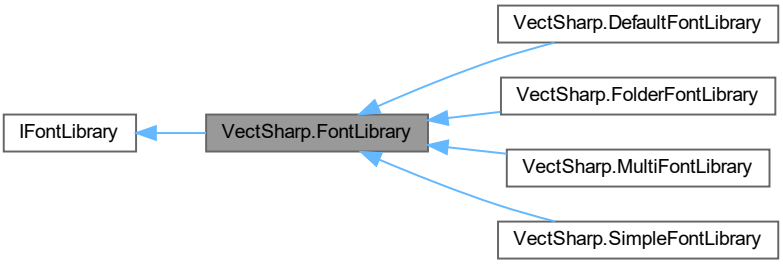
The documentation for this class was generated from the following file:

- VectSharp/FontLibrary.cs

7.48 VectSharp.FontLibrary Class Reference

Abstract class with a default implementation of font family fallbacks.

Inheritance diagram for VectSharp.FontLibrary:



Public Member Functions

- abstract FontFamily ResolveFontFamily (string fontFamily)

  Create a new font family from the specified family name or true type file. If the family name or the true type file are not valid, an exception might be raised.

Parameters

fontFamily	*The name of the font family to create, or the path to a TTF file.*

Returns

If the font family name or the true type file is valid, a FontFamily object corresponding to the specified font family.

- abstract FontFamily ResolveFontFamily (FontFamily.StandardFontFamilies standardFontFamily)

  Create a new font family from the specified standard font family name.

Parameters

standardFontFamily	*The standard name of the font family.*

Returns

A FontFamily object corresponding to the specified font family.

- virtual FontFamily ResolveFontFamily (string fontFamily, params string[ ] fallback)

  Create a new font family from the specified family name or true type file. If the family name or the true type file are not valid, try to instantiate the font family using the fallback . If none of the fallback family names or true type files are valid, an exception might be raised.

Parameters

fontFamily	*The name of the font family to create, or the path to a TTF file.*
fallback	*Names of additional font families or TTF files, which will be tried if the first fontFamily is not valid.*

Returns

A FontFamily object corresponding to the first of the specified font families that is valid.

- virtual FontFamily ResolveFontFamily (string fontFamily, FontFamily.StandardFontFamilies finalFallback, params string[ ] fallback)

  Create a new font family from the specified family name or true type file. If the family name or the true type file are not valid, try to instantiate the font family using the fallback . If none of the fallback family names or true type files are valid, instantiate a standard font family using the finalFallback .

Parameters

fontFamily	*The name of the font family to create, or the path to a TTF file.*
fallback	*Names of additional font families or TTF files, which will be tried if the first fontFamily is not valid.*
finalFallback	*The standard name of the font family that will be used if none of the fallback families are valid.*

Returns

A FontFamily object corresponding to the first of the specified font families that is valid.

7.48.1 Detailed Description

Abstract class with a default implementation of font family fallbacks.

Definition at line 67 of file FontLibrary.cs.

7.48.2 Member Function Documentation

7.48.2.1 ResolveFontFamily() [1/4]

```
abstract FontFamily VectSharp.FontLibrary.ResolveFontFamily (
            FontFamily.StandardFontFamilies standardFontFamily )  [pure virtual]
```

Create a new font family from the specified standard font family name.

Parameters

standardFontFamily	The standard name of the font family.

Returns

A FontFamily object corresponding to the specified font family.

Implements VectSharp.IFontLibrary.

Implemented in VectSharp.SimpleFontLibrary, VectSharp.DefaultFontLibrary, VectSharp.FolderFontLibrary, and VectSharp.MultiFontLibrary.

7.48.2.2 ResolveFontFamily() [2/4]

```
abstract FontFamily VectSharp.FontLibrary.ResolveFontFamily (
            string fontFamily )  [pure virtual]
```

Create a new font family from the specified family name or true type file. If the family name or the true type file are not valid, an exception might be raised.

Parameters

fontFamily	The name of the font family to create, or the path to a TTF file.

Returns

If the font family name or the true type file is valid, a FontFamily object corresponding to the specified font family.

Implements VectSharp.IFontLibrary.

Implemented in VectSharp.SimpleFontLibrary, VectSharp.DefaultFontLibrary, VectSharp.FolderFontLibrary, and VectSharp.MultiFontLibrary.

7.48.2.3 ResolveFontFamily() [3/4]

```
virtual FontFamily VectSharp.FontLibrary.ResolveFontFamily (
            string fontFamily,
            FontFamily.StandardFontFamilies finalFallback,
            params string[] fallback )  [virtual]
```

Create a new font family from the specified family name or true type file. If the family name or the true type file are not valid, try to instantiate the font family using the *fallback* . If none of the fallback family names or true type files are valid, instantiate a standard font family using the *finalFallback* .

Parameters

fontFamily	The name of the font family to create, or the path to a TTF file.
fallback	Names of additional font families or TTF files, which will be tried if the first *fontFamily* is not valid.
finalFallback	The standard name of the font family that will be used if none of the fallback families are valid.

Returns

A FontFamily object corresponding to the first of the specified font families that is valid.

Implements VectSharp.IFontLibrary.

Definition at line 129 of file FontLibrary.cs.

7.48.2.4 ResolveFontFamily() [4/4]

```
virtual FontFamily VectSharp.FontLibrary.ResolveFontFamily (
            string fontFamily,
            params string[] fallback )  [virtual]
```

Create a new font family from the specified family name or true type file. If the family name or the true type file are not valid, try to instantiate the font family using the *fallback* . If none of the fallback family names or true type files are valid, an exception might be raised.

Parameters

fontFamily	The name of the font family to create, or the path to a TTF file.
fallback	Names of additional font families or TTF files, which will be tried if the first *fontFamily* is not valid.

Returns

A FontFamily object corresponding to the first of the specified font families that is valid.

Implements VectSharp.IFontLibrary.

Definition at line 76 of file FontLibrary.cs.

The documentation for this class was generated from the following file:

- VectSharp/FontLibrary.cs

7.49 VectSharp.Font.FontUnderline Class Reference

Represents options to underline text.

Properties

- bool SkipDescenders [get, set]

  Determines whether the underline skips the parts of the glyph that would intersect with it or not.
- double Position [get, set]

  Determines the position of the top of the underline with respect to the text baseline. Positive values are below the baseline, negative values are above it. This is expressed as a fraction of the font size.
- double Thickness [get, set]

  Determines the thickness of the underline, expressed as a fraction of the font size.
- LineCaps LineCap [get, set]

  Determines the caps at the start and end of the underline.
- bool FollowItalicAngle [get, set]

  Determine whether the shape of the underline is slanted to follow the angle of italic fonts.

7.49.1 Detailed Description

Represents options to underline text.

Definition at line 37 of file Font.cs.

7.49.2 Property Documentation

7.49.2.1 FollowItalicAngle

```
bool VectSharp.Font.FontUnderline.FollowItalicAngle  [get], [set]
```

Determine whether the shape of the underline is slanted to follow the angle of italic fonts.

Definition at line 62 of file Font.cs.

7.49.2.2 LineCap

```
LineCaps VectSharp.Font.FontUnderline.LineCap  [get], [set]
```

Determines the caps at the start and end of the underline.

Definition at line 57 of file Font.cs.

7.49.2.3 Position

```
double VectSharp.Font.FontUnderline.Position  [get], [set]
```

Determines the position of the top of the underline with respect to the text baseline. Positive values are below the baseline, negative values are above it. This is expressed as a fraction of the font size.

Definition at line 47 of file Font.cs.

7.49.2.4 SkipDescenders

```
bool VectSharp.Font.FontUnderline.SkipDescenders  [get], [set]
```

Determines whether the underline skips the parts of the glyph that would intersect with it or not.

Definition at line 42 of file Font.cs.

7.49.2.5 Thickness

```
double VectSharp.Font.FontUnderline.Thickness  [get], [set]
```

Determines the thickness of the underline, expressed as a fraction of the font size.

Definition at line 52 of file Font.cs.

The documentation for this class was generated from the following file:

- VectSharp/Font.cs

7.50 VectSharp.Markdown.FormattedString Struct Reference

Represents a string with associated formatting information.

Public Member Functions

- FormattedString (string text, Colour colour, bool isBold, bool isItalic)
  Creates a new FormattedString instance.

Properties

- string Text [get]
  The text represented by this object.
- Colour Colour [get]
  The colour of the text.
- bool IsBold [get]
  Whether the text should be rendered as bold or not.
- bool IsItalic [get]
  Whether the text should be rendered as italic or not.

7.50.1 Detailed Description

Represents a string with associated formatting information.

Definition at line 32 of file SyntaxHighlighting.cs.

7.50.2 Constructor & Destructor Documentation

7.50.2.1 FormattedString()

```
VectSharp.Markdown.FormattedString.FormattedString (
            string text,
            Colour colour,
            bool isBold,
            bool isItalic )
```

Creates a new FormattedString instance.

Parameters

text	The text of the object.
colour	The colour of the text.
isBold	Whether the text should be rendered as bold or not.
isItalic	Whether the text should be rendered as italic or not.

Definition at line 61 of file SyntaxHighlighting.cs.

7.50.3 Property Documentation

7.50.3.1 Colour

```
Colour VectSharp.Markdown.FormattedString.Colour  [get]
```

The colour of the text.

Definition at line 42 of file SyntaxHighlighting.cs.

7.50.3.2 IsBold

```
bool VectSharp.Markdown.FormattedString.IsBold  [get]
```

Whether the text should be rendered as bold or not.

Definition at line 47 of file SyntaxHighlighting.cs.

7.50.3.3 IsItalic

```
bool VectSharp.Markdown.FormattedString.IsItalic  [get]
```

Whether the text should be rendered as italic or not.

Definition at line 52 of file SyntaxHighlighting.cs.

7.50.3.4 Text

```
string VectSharp.Markdown.FormattedString.Text  [get]
```

The text represented by this object.

Definition at line 37 of file SyntaxHighlighting.cs.

The documentation for this struct was generated from the following file:

- VectSharp.Markdown/SyntaxHighlighting.cs

7.51 VectSharp.FormattedText Class Reference

Represents a run of text that should be drawn with the same style.

Public Member Functions

- FormattedText (string text, Font font, Script script=Script.Normal, Brush brush=null)

  Creates a new FormattedText instance with the specified text , font , script position and brush .

Static Public Member Functions

- static IEnumerable< FormattedText > Format (string text, Font normalFont, Font boldFont, Font italicFont, Font boldItalicFont, Brush defaultBrush=null)

  Parse the formatting information contained in a text string into a collection of FormattedText objects.
- static IEnumerable< FormattedText > Format (string text, FontFamily.StandardFontFamilies fontFamily, double fontSize, bool defaultUnderline=false, Brush defaultBrush=null)

  Parse the formatting information contained in a text string into a collection of FormattedText objects, using fonts from a standard font family.

Properties

- string Text [get]

  Represents the text represented by this instance.
- Font Font [get]

  Represents the font that should be used to draw the text.
- Script Script [get]

  Represents the position of the text.
- Brush Brush [get]

  Represents the brush that should be used to draw the text. If this is null, the default brush is used.

7.51.1 Detailed Description

Represents a run of text that should be drawn with the same style.

Definition at line 50 of file FormattedText.cs.

7.51.2 Constructor & Destructor Documentation

7.51.2.1 FormattedText()

```
VectSharp.FormattedText.FormattedText (
            string text,
            Font font,
            Script script = Script.Normal,
            Brush brush = null )
```

Creates a new FormattedText instance with the specified *text* , *font* , *script* position and *brush* .

Parameters

text	The text that will be contained in the new FormattedText.
font	The font that will be used by the new FormattedText.
script	The script position of the new FormattedText.
brush	The brush that will be used by the new FormattedText.

Definition at line 79 of file FormattedText.cs.

7.51.3 Member Function Documentation

7.51.3.1 Format() [1/2]

```
static IEnumerable< FormattedText > VectSharp.FormattedText.Format (
            string text,
            Font normalFont,
            Font boldFont,
            Font italicFont,
            Font boldItalicFont,
            Brush defaultBrush = null )  [static]
```

Parse the formatting information contained in a text string into a collection of FormattedText objects.

Parameters

text	The string containing formatting information. Format information is specified using HTML-like tags: • or are used for bold text; • or are used for text in italics; • <u></u> are used for underlined text; • and are used, respectively, for superscript and subscript text; • <#COLOUR></#> is used to specify the colour of the text, where COLOUR is a CSS colour string (e.g. <#red>, <#0080FF>, or <#rgba(128, 80, 52, 0.5)>).
normalFont	The font that will be used for text that is neither bold nor italic.
boldFont	The font that will be used for text that is bold. Note that this does not necessarily have to be a bold font; this is just the font that is applied to text contained within tags.
italicFont	The font that will be used for text that is in italics. Note that this does not necessarily have to be an italic font; this is just the font that is applied to text contained within tags.
boldItalicFont	The font that will be used for text that is both in bold and in italics.
defaultBrush	The default Brush that will be used for text runs that do not specify a colour. If this is null, the default Brush will be the one specified in the painting call.

Returns

A lazy collection of FormattedText objects. Note that every enumeration of this collection causes the text to be parsed again; if you need to enumerate this collection more than once, you should probably convert it e.g. to a List<T>.

Definition at line 105 of file FormattedText.cs.

7.51.3.2 Format() [2/2]

```
static IEnumerable< FormattedText > VectSharp.FormattedText.Format (
            string text,
            FontFamily.StandardFontFamilies fontFamily,
            double fontSize,
            bool defaultUnderline = false,
            Brush defaultBrush = null )  [static]
```

Parse the formatting information contained in a text string into a collection of FormattedText objects, using fonts from a standard font family.

Parameters

text	The string containing formatting information. Format information is specified using HTML-like tags: • `<b></b>` or `<strong></strong>` are used for bold text; • `<i></i>` or `<em></em>` are used for text in italics; • `<u></u>` are used for underlined text; • `<sup></sup>` and `<sub></sub>` are used, respectively, for superscript and subscript text; • `<#COLOUR></#>` is used to specify the colour of the text, where `COLOUR` is a CSS colour string (e.g. `<#red>`, `<#0080FF>`, or `<#rgba(128, 80, 52, 0.5)>`).
fontFamily	The font family from which the fonts will be created. If this is a regular font family, the bold, italic and bold-italic versions of the font will be used for the formatted text. Otherwise, the relevant font styles will be toggled (e.g. if the supplied font family is bold, then regular text in the formatted string will be displayed as bold, while bold text in the formatted string will be displayed as regular text).
fontSize	The size of the fonts to use.
defaultUnderline	Determines whether text should be underlined by default. This is toggled by `<u></u>` tags.
defaultBrush	The default Brush that will be used for text runs that do not specify a colour. If this is `null`, the default Brush will be the one specified in the painting call.

Returns

A lazy collection of FormattedText objects. Note that every enumeration of this collection causes the text to be parsed again; if you need to enumerate this collection more than once, you should probably convert it e.g. to a List<T>.

Definition at line 287 of file FormattedText.cs.

7.51.4 Property Documentation

7.51.4.1 Brush

```
Brush VectSharp.FormattedText.Brush  [get]
```

Represents the brush that should be used to draw the text. If this is null, the default brush is used.

Definition at line 70 of file FormattedText.cs.

7.51.4.2 Font

```
Font VectSharp.FormattedText.Font  [get]
```

Represents the font that should be used to draw the text.

Definition at line 60 of file FormattedText.cs.

7.51.4.3 Script

```
Script VectSharp.FormattedText.Script  [get]
```

Represents the position of the text.

Definition at line 65 of file FormattedText.cs.

7.51.4.4 Text

```
string VectSharp.FormattedText.Text  [get]
```

Represents the text represented by this instance.

Definition at line 55 of file FormattedText.cs.

The documentation for this class was generated from the following file:

- VectSharp/FormattedText.cs

7.52 VectSharp.FormattedTextExtensions Class Reference

Contains extension methods for collections of FormattedText objects.

Static Public Member Functions

- static Font.DetailedFontMetrics Measure (this IEnumerable< FormattedText > text)
  Measures a collection of FormattedText objects.
- static string GetText (this IEnumerable< FormattedText > text)
  Extracts the text from a collection of FormattedText objects.

7.52.1 Detailed Description

Contains extension methods for collections of FormattedText objects.

Definition at line 542 of file FormattedText.cs.

7.52.2 Member Function Documentation

7.52.2.1 GetText()

```
static string VectSharp.FormattedTextExtensions.GetText (
            this IEnumerable< FormattedText > text )  [static]
```

Extracts the text from a collection of FormattedText objects.

Parameters

text	The collection of FormattedText objects whose text should be extracted.

Returns

A text rappresentation of the collection of FormattedText objects.

Definition at line 644 of file FormattedText.cs.

7.52.2.2 Measure()

```
static Font.DetailedFontMetrics VectSharp.FormattedTextExtensions.Measure (
            this IEnumerable< FormattedText > text )  [static]
```

Measures a collection of FormattedText objects.

Parameters

text	The collection of FormattedText objects to be measured.

Returns

A Font.DetailedFontMetrics containing detailed measurements for the text obtained by composing the elements in the FormattedText collection.

Definition at line 634 of file FormattedText.cs.

The documentation for this class was generated from the following file:

- VectSharp/FormattedText.cs

7.53 VectSharp.Frame Class Reference

A key frame for an animation.

Public Member Functions

- Frame (Graphics graphics, double duration)

  Creates a new Frame with the specified contents and duration.

Properties

- double Duration [get]

  The duration of the frame, in milliseconds.
- Graphics Graphics [get]

  The contents of the frame.

7.53.1 Detailed Description

A key frame for an animation.

Definition at line 1193 of file Animation.cs.

7.53.2 Constructor & Destructor Documentation

7.53.2.1 Frame()

```
VectSharp.Frame.Frame (
            Graphics graphics,
            double duration )
```

Creates a new Frame with the specified contents and duration.

Parameters

graphics	The contents of the frame.
duration	The duration of the frame, in milliseconds.

Definition at line 1210 of file Animation.cs.

7.53.3 Property Documentation

7.53.3.1 Duration

```
double VectSharp.Frame.Duration  [get]
```

The duration of the frame, in milliseconds.

Definition at line 1198 of file Animation.cs.

7.53.3.2 Graphics

```
Graphics VectSharp.Frame.Graphics  [get]
```

The contents of the frame.

Definition at line 1203 of file Animation.cs.

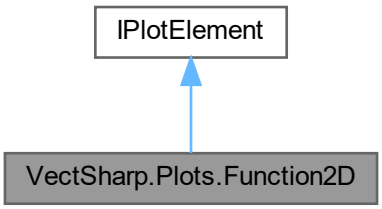
The documentation for this class was generated from the following file:

- VectSharp/Animation.cs

7.54 VectSharp.Plots.Function2D Class Reference

A plot element that plots a function of two variables.

Inheritance diagram for VectSharp.Plots.Function2D:



Public Types

- enum PlotType

  Describes the kind of plots that can be produced.

Public Member Functions

- Function2D (Function2DGrid function, IContinuousInvertibleCoordinateSystem coordinateSystem)

  Create a new Function2D instance.
- unsafe void Plot (Graphics target)

  Draw the plot element on the specified target Graphics.

Parameters

target	*The Graphics on which to draw.*

Properties

- IDataPointElement SampledPointElement = new PathDataPointElement() `[get, set]`

  The symbol to draw at the sampled points.
- int RasterResolutionX = 512 `[get, set]`

  Resolution on the X axis for the rasterised tesselation.
- int RasterResolutionY = 512 `[get, set]`

  Resolution on the Y axis for the rasterised tesselation.
- Function2DGrid Function `[get, set]`

  The function to plot.
- PlotType Type = PlotType.SampledPoints `[get, set]`

  The kind of plot that is produced.

- Func< double, Colour > Colouring = x => { x = Math.Max(0, Math.Min(1, x)); return Colour.FromRgb(x, x, x); } `[get, set]`

  A function associating sampled function values to a Colour. You should set this to a function accepting a single `double` argument ranging between 0 and 1, and returning the corresponding colour. The default value returns black 0 and white for 1.
- string Tag `[get, set]`

  A tag to identify the function in the plot.
- IContinuousInvertibleCoordinateSystem CoordinateSystem `[get, set]`

  The coordinate system used to transform the points from data space to plot space.

7.54.1 Detailed Description

A plot element that plots a function of two variables.

Definition at line 520 of file Function2D.cs.

7.54.2 Member Enumeration Documentation

7.54.2.1 PlotType

```
enum VectSharp.Plots.Function2D.PlotType
```

Describes the kind of plots that can be produced.

Definition at line 525 of file Function2D.cs.

7.54.3 Constructor & Destructor Documentation

7.54.3.1 Function2D()

```
VectSharp.Plots.Function2D.Function2D (
            Function2DGrid function,
            IContinuousInvertibleCoordinateSystem coordinateSystem )
```

Create a new Function2D instance.

Parameters

function	The function to plot.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 594 of file Function2D.cs.

7.54.4 Member Function Documentation

7.54.4.1 Plot()

```
unsafe void VectSharp.Plots.Function2D.Plot (
            Graphics target )
```

Draw the plot element on the specified *target* Graphics.

Parameters

target	The Graphics on which to draw.

Implements VectSharp.Plots.IPlotElement.

Definition at line 601 of file Function2D.cs.

7.54.5 Property Documentation

7.54.5.1 Colouring

```
Func<double, Colour> VectSharp.Plots.Function2D.Colouring = x => { x = Math.Max(0, Math.↩
Min(1, x)); return Colour.FromRgb(x, x, x); }  [get], [set]
```

A function associating sampled function values to a Colour. You should set this to a function accepting a single `double` argument ranging between 0 and 1, and returning the corresponding colour. The default value returns black 0 and white for 1.

Definition at line 576 of file Function2D.cs.

7.54.5.2 CoordinateSystem

```
IContinuousInvertibleCoordinateSystem VectSharp.Plots.Function2D.CoordinateSystem  [get], [set]
```

The coordinate system used to transform the points from data space to plot space.

Implements VectSharp.Plots.IPlotElement.

Definition at line 586 of file Function2D.cs.

7.54.5.3 Function

```
Function2DGrid VectSharp.Plots.Function2D.Function  [get], [set]
```

The function to plot.

Definition at line 564 of file Function2D.cs.

7.54.5.4 RasterResolutionX

```
int VectSharp.Plots.Function2D.RasterResolutionX = 512  [get], [set]
```

Resolution on the X axis for the rasterised tesselation.

Definition at line 554 of file Function2D.cs.

7.54.5.5 RasterResolutionY

```
int VectSharp.Plots.Function2D.RasterResolutionY = 512  [get], [set]
```

Resolution on the Y axis for the rasterised tesselation.

Definition at line 559 of file Function2D.cs.

7.54.5.6 SampledPointElement

```
IDataPointElement VectSharp.Plots.Function2D.SampledPointElement = new PathDataPointElement()
[get], [set]
```

The symbol to draw at the sampled points.

Definition at line 549 of file Function2D.cs.

7.54.5.7 Tag

```
string VectSharp.Plots.Function2D.Tag  [get], [set]
```

A tag to identify the function in the plot.

Definition at line 581 of file Function2D.cs.

7.54.5.8 Type

```
PlotType VectSharp.Plots.Function2D.Type = PlotType.SampledPoints  [get], [set]
```

The kind of plot that is produced.

Definition at line 569 of file Function2D.cs.

The documentation for this class was generated from the following file:

- VectSharp.Plots/Function2D.cs

7.55 VectSharp.Plots.Function2DGrid Class Reference

Represents a function of two variables that has been sampled in some points.

Public Types

- enum GridType

  Describes the arrangement of the points that have been sampled.

Public Member Functions

- Function2DGrid (IReadOnlyList< IReadOnlyList< double > > dataPoints)

  Create a new Function2DGrid from a list of sampled values.
- Function2DGrid (Func< double[ ], double > function, double minX, double minY, double maxX, double maxY, int stepsX, int stepsY, GridType type)

  Create a new Function2DGrid by sampling the provided function.
- Function2DGrid ToRectangular ()

  Converts a hexagonal grid into a rectangular grid.

Properties

- IReadOnlyList< IReadOnlyList< double > > DataPoints [get]

  The points where the function has been sampled.
- double MinX [get]

  The minimum X value that has been sampled.
- double MaxX [get]

  The maximum X value that has been sampled.
- double MinY [get]

  The minimum Y value that has been sampled.
- double MaxY [get]

  The maximum Y value that has been sampled.
- double MinZ [get]

  The minimum value that has been obtained for the function.
- double MaxZ [get]

  The maximum value that has been obtained for the function.
- int StepsX [get]

  If the function has been sampled along a regular grid, the number of steps between MinX and MaxX on the X axis.
- int StepsY [get]

  If the function has been sampled along a regular grid, the number of steps between MinY and MaxY on the X axis.
- GridType Type [get]

  The type of grid.

7.55.1 Detailed Description

Represents a function of two variables that has been sampled in some points.

Definition at line 29 of file Function2D.cs.

7.55.2 Member Enumeration Documentation

7.55.2.1 GridType

```
enum VectSharp.Plots.Function2DGrid.GridType
```

Describes the arrangement of the points that have been sampled.

Definition at line 34 of file Function2D.cs.

7.55.3 Constructor & Destructor Documentation

7.55.3.1 Function2DGrid() [1/2]

```
VectSharp.Plots.Function2DGrid.Function2DGrid (
            IReadOnlyList< IReadOnlyList< double > > dataPoints )
```

Create a new Function2DGrid from a list of sampled values.

Parameters

dataPoints	The sampled values. Each element of this IReadOnlyList<T> should be a collection of three values: the X coordinate of the sampled point, the Y coordinate of the sampled point, and the value of the function at that point.

Definition at line 117 of file Function2D.cs.

7.55.3.2 Function2DGrid() [2/2]

```
VectSharp.Plots.Function2DGrid.Function2DGrid (
            Func< double[], double > function,
            double minX,
            double minY,
            double maxX,
```

```
double maxY,
int stepsX,
int stepsY,
GridType type )
```

Create a new Function2DGrid by sampling the provided function.

Parameters

function	The function to sample.
minX	The minimum X value at which the function should be sampled.
minY	The minimum Y value at which the function should be sampled.
maxX	The maximum X value at which the function should be sampled.
maxY	The maximum Y value at which the function should be sampled.
stepsX	If *type* is not GridType.Irregular, the number of steps between *minX* and *maxX* on the X axis. Otherwise, the number of sampled points is determined by multiplying *stepsX* and *stepsY* together.
stepsY	If *type* is not GridType.Irregular, the number of steps between *minY* and *maxY* on the Y axis. Otherwise, the number of sampled points is determined by multiplying *stepsX* and *stepsY* together.
type	The strategy used to select points to sample. If this is GridType.Irregular, uniformly distributed random points between (*minX* , *minY*) and (*maxX* , *maxY*) are sampled.

Definition at line 163 of file Function2D.cs.

7.55.4 Member Function Documentation

7.55.4.1 ToRectangular()

```
Function2DGrid VectSharp.Plots.Function2DGrid.ToRectangular ( )
```

Converts a hexagonal grid into a rectangular grid.

Returns

If Type is GridType.Rectangular, this method returns the current instance.
If Type is GridType.HexagonHorizontal or GridType.HexagonVertical, a new Function2DGrid with Type equal to GridType.Rectangular is returned. The sampled points in this grid are obtained by performing a bilinear interpolation on the sampled points from this grid. The returned grid will always be "denser" than the current instance.
If Type is GridType.Irregular, an InvalidOperationException is thrown.

Exceptions

InvalidOperationException	Thrown if Type is GridType.Irregular.

Definition at line 322 of file Function2D.cs.

7.55.5 Property Documentation

7.55.5.1 DataPoints

```
IReadOnlyList<IReadOnlyList<double> > VectSharp.Plots.Function2DGrid.DataPoints [get]
```

The points where the function has been sampled.

Definition at line 62 of file Function2D.cs.

7.55.5.2 MaxX

```
double VectSharp.Plots.Function2DGrid.MaxX [get]
```

The maximum X value that has been sampled.

Definition at line 72 of file Function2D.cs.

7.55.5.3 MaxY

```
double VectSharp.Plots.Function2DGrid.MaxY [get]
```

The maximum Y value that has been sampled.

Definition at line 82 of file Function2D.cs.

7.55.5.4 MaxZ

```
double VectSharp.Plots.Function2DGrid.MaxZ [get]
```

The maximum value that has been obtained for the function.

Definition at line 92 of file Function2D.cs.

7.55.5.5 MinX

```
double VectSharp.Plots.Function2DGrid.MinX [get]
```

The minimum X value that has been sampled.

Definition at line 67 of file Function2D.cs.

7.55.5.6 MinY

```
double VectSharp.Plots.Function2DGrid.MinY  [get]
```

The minimum Y value that has been sampled.

Definition at line 77 of file Function2D.cs.

7.55.5.7 MinZ

```
double VectSharp.Plots.Function2DGrid.MinZ  [get]
```

The minimum value that has been obtained for the function.

Definition at line 87 of file Function2D.cs.

7.55.5.8 StepsX

```
int VectSharp.Plots.Function2DGrid.StepsX  [get]
```

If the function has been sampled along a regular grid, the number of steps between MinX and MaxX on the X axis.

Definition at line 98 of file Function2D.cs.

7.55.5.9 StepsY

```
int VectSharp.Plots.Function2DGrid.StepsY  [get]
```

If the function has been sampled along a regular grid, the number of steps between MinY and MaxY on the X axis.

Definition at line 104 of file Function2D.cs.

7.55.5.10 Type

```
GridType VectSharp.Plots.Function2DGrid.Type  [get]
```

The type of grid.

Definition at line 109 of file Function2D.cs.

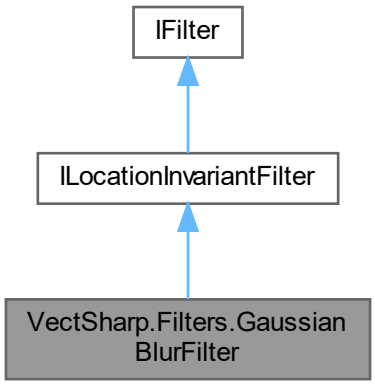
The documentation for this class was generated from the following file:

- VectSharp.Plots/Function2D.cs

7.56 VectSharp.Filters.GaussianBlurFilter Class Reference

Represents a filter that applies a Gaussian blur effect.

Inheritance diagram for VectSharp.Filters.GaussianBlurFilter:



Public Member Functions

- GaussianBlurFilter (double standardDeviation)

  Creates a new GaussianBlurFilter with the specified standard deviation.
- RasterImage Filter (RasterImage image, double scale)

  Applies the filter to a RasterImage.

Parameters

image	*The RasterImage to which the filter will be applied.*
scale	*The scale of the image with respect to the filter.*

Returns

A new RasterImage containing the filtered image. The source image is left unaltered.

Properties

- double StandardDeviation `[get]`

  The standard deviation of the Gaussian blur.
- Point TopLeftMargin `[get]`

  Determines how much the area of the filter's subject should be expanded on the top-left to accommodate the results of the filter.
- Point BottomRightMargin `[get]`

  Determines how much the area of the filter's subject should be expanded on the bottom-right to accommodate the results of the filter.

7.56.1 Detailed Description

Represents a filter that applies a Gaussian blur effect.

Definition at line 26 of file GaussianBlurFilter.cs.

7.56.2 Constructor & Destructor Documentation

7.56.2.1 GaussianBlurFilter()

```
VectSharp.Filters.GaussianBlurFilter.GaussianBlurFilter (
            double standardDeviation )
```

Creates a new GaussianBlurFilter with the specified standard deviation.

Parameters

standardDeviation	The standard deviation of the Gaussian blur.

Definition at line 43 of file GaussianBlurFilter.cs.

7.56.3 Member Function Documentation

7.56.3.1 Filter()

```
RasterImage VectSharp.Filters.GaussianBlurFilter.Filter (
            RasterImage image,
            double scale )
```

Applies the filter to a RasterImage.

Parameters

image	The RasterImage to which the filter will be applied.
scale	The scale of the image with respect to the filter.

Returns

A new RasterImage containing the filtered image. The source *image* is left unaltered.

Implements VectSharp.Filters.ILocationInvariantFilter.

Definition at line 51 of file GaussianBlurFilter.cs.

7.56.4 Property Documentation

7.56.4.1 BottomRightMargin

```
Point VectSharp.Filters.GaussianBlurFilter.BottomRightMargin  [get]
```

Determines how much the area of the filter's subject should be expanded on the bottom-right to accommodate the results of the filter.

Implements VectSharp.Filters.IFilter.

Definition at line 37 of file GaussianBlurFilter.cs.

7.56.4.2 StandardDeviation

```
double VectSharp.Filters.GaussianBlurFilter.StandardDeviation  [get]
```

The standard deviation of the Gaussian blur.

Definition at line 31 of file GaussianBlurFilter.cs.

7.56.4.3 TopLeftMargin

```
Point VectSharp.Filters.GaussianBlurFilter.TopLeftMargin  [get]
```

Determines how much the area of the filter's subject should be expanded on the top-left to accommodate the results of the filter.

Implements VectSharp.Filters.IFilter.

Definition at line 34 of file GaussianBlurFilter.cs.

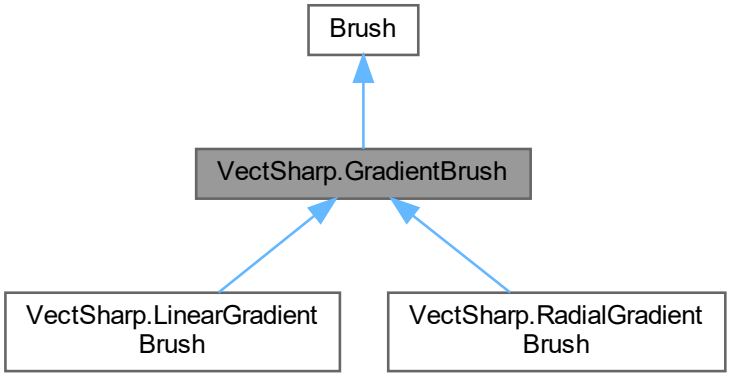
The documentation for this class was generated from the following file:

- VectSharp/Filters/GaussianBlurFilter.cs

7.57 VectSharp.GradientBrush Class Reference

Represents a brush painting with a gradient.

Inheritance diagram for VectSharp.GradientBrush:



Properties

- GradientStops GradientStops [get]

  The colour stops in the gradient.

Additional Inherited Members

7.57.1 Detailed Description

Represents a brush painting with a gradient.

Definition at line 270 of file Brush.cs.

7.57.2 Property Documentation

7.57.2.1 GradientStops

```
GradientStops VectSharp.GradientBrush.GradientStops [get]
```

The colour stops in the gradient.

Definition at line 275 of file Brush.cs.

The documentation for this class was generated from the following file:

- VectSharp/Brush.cs

7.58 VectSharp.Gradients Class Reference

Standard gradients.

Static Public Member Functions

- static Colour MagmaColouring (double x)

  Turbo gradient, based on the homonymous colour scale included in the "viridis" R package ().

7.58.1 Detailed Description

Standard gradients.

Definition at line 13 of file Gradients.cs.

7.58.2 Member Function Documentation

7.58.2.1 CividisColouring()

```
static Colour VectSharp.Gradients.CividisColouring (
            double x )  [static]
```

Cividis colour map, based on the homonymous colour scale included in the "viridis" R package ().

Parameters

x	The position in the map (ranging from 0 to 1).

Returns

The colour at the corresponding position in the colour map.

Definition at line 162 of file Gradients.cs.

7.58.2.2 InfernoColouring()

```
static Colour VectSharp.Gradients.InfernoColouring (
            double x )  [static]
```

Inferno colour map, based on the homonymous colour scale included in the "viridis" R package ().

Parameters

x	The position in the map (ranging from 0 to 1).

Returns

The colour at the corresponding position in the colour map.

Definition at line 126 of file Gradients.cs.

7.58.2.3 MagmaColouring()

```
static Colour VectSharp.Gradients.MagmaColouring (
            double x )  [static]
```

Magma colour map, based on the homonymous colour scale included in the "viridis" R package ().

Parameters

x	The position in the map (ranging from 0 to 1).

Returns

The colour at the corresponding position in the colour map.

Definition at line 114 of file Gradients.cs.

7.58.2.4 MakoColouring()

```
static Colour VectSharp.Gradients.MakoColouring (
            double x )  [static]
```

Mako colour map, based on the homonymous colour scale included in the "viridis" R package ().

Parameters

x	The position in the map (ranging from 0 to 1).

Returns

The colour at the corresponding position in the colour map.

Definition at line 186 of file Gradients.cs.

7.58.2.5 PlasmaColouring()

```
static Colour VectSharp.Gradients.PlasmaColouring (
            double x )  [static]
```

Plasma colour map, based on the homonymous colour scale included in the "viridis" R package ().

Parameters

x	The position in the map (ranging from 0 to 1).

Returns

The colour at the corresponding position in the colour map.

Definition at line 138 of file Gradients.cs.

7.58.2.6 RocketColouring()

```
static Colour VectSharp.Gradients.RocketColouring (
            double x )  [static]
```

Rocket colour map, based on the homonymous colour scale included in the "viridis" R package ().

Parameters

x	The position in the map (ranging from 0 to 1).

Returns

The colour at the corresponding position in the colour map.

Definition at line 174 of file Gradients.cs.

7.58.2.7 TurboColouring()

```
static Colour VectSharp.Gradients.TurboColouring (
            double x )  [static]
```

Turbo colour map, based on the homonymous colour scale included in the "viridis" R package ().

Parameters

x	The position in the map (ranging from 0 to 1).

Returns

The colour at the corresponding position in the colour map.

Definition at line 198 of file Gradients.cs.

7.58.2.8 ViridisColouring()

```
static Colour VectSharp.Gradients.ViridisColouring (
            double x )  [static]
```

Viridis colour map, based on the homonymous colour scale included in the "viridis" R package ().

Parameters

x	The position in the map (ranging from 0 to 1).

Returns

The colour at the corresponding position in the colour map.

Definition at line 150 of file Gradients.cs.

7.58.3 Member Data Documentation

7.58.3.1 Cividis

```
readonly GradientStops VectSharp.Gradients.Cividis = new GradientStops(from el in Enumerable.↩
Range(0, 21) let ind = (int)Math.Round(12.75 * el) select new GradientStop(Colour.FromRgb(Cividis↩
RGB[ind, 0], CividisRGB[ind, 1], CividisRGB[ind, 2]), el * 0.05))  [static]
```

Cividis gradient, based on the homonymous colour scale included in the "viridis" R package ().

Definition at line 92 of file Gradients.cs.

7.58.3.2 Inferno

```
readonly GradientStops VectSharp.Gradients.Inferno = new GradientStops(from el in Enumerable.↩
Range(0, 21) let ind = (int)Math.Round(12.75 * el) select new GradientStop(Colour.FromRgb(Inferno↩
RGB[ind, 0], InfernoRGB[ind, 1], InfernoRGB[ind, 2]), el * 0.05))  [static]
```

Inferno gradient, based on the homonymous colour scale included in the "viridis" R package ().

Definition at line 77 of file Gradients.cs.

7.58.3.3 Magma

```
readonly GradientStops VectSharp.Gradients.Magma = new GradientStops(from el in Enumerable.↩
Range(0, 21) let ind = (int)Math.Round(12.75 * el) select new GradientStop(Colour.FromRgb(Magma↩
RGB[ind, 0], MagmaRGB[ind, 1], MagmaRGB[ind, 2]), el * 0.05))  [static]
```

Magma gradient, based on the homonymous colour scale included in the "viridis" R package ().

Definition at line 72 of file Gradients.cs.

7.58.3.4 Mako

```
readonly GradientStops VectSharp.Gradients.Mako = new GradientStops(from el in Enumerable.↩
Range(0, 21) let ind = (int)Math.Round(12.75 * el) select new GradientStop(Colour.FromRgb(Mako↩
RGB[ind, 0], MakoRGB[ind, 1], MakoRGB[ind, 2]), el * 0.05))  [static]
```

Mako gradient, based on the homonymous colour scale included in the "viridis" R package ().

Definition at line 102 of file Gradients.cs.

7.58.3.5 MutedRainbow

```
readonly GradientStops VectSharp.Gradients.MutedRainbow = new GradientStops(new GradientStop(Colour.FromRgb(22
204, 119), 0), new GradientStop(Colour.FromRgb(153, 153, 51), 0.125), new GradientStop(Colour.FromRgb(17,
119, 51), 0.25), new GradientStop(Colour.FromRgb(68, 170, 153), 0.375), new GradientStop(Colour.FromRgb(136,
204, 238), 0.5), new GradientStop(Colour.FromRgb(51, 34, 136), 0.625), new GradientStop(Colour.FromRgb(170,
68, 153), 0.75), new GradientStop(Colour.FromRgb(136, 34, 85), 0.875), new GradientStop(Colour.FromRgb(204,
102, 119), 1))  [static]
```

Rainbow gradient with Paul Tol's Muted palette ().

Definition at line 53 of file Gradients.cs.

7.58.3.6 MutedRainbowDiscrete

```
readonly GradientStops VectSharp.Gradients.MutedRainbowDiscrete = new GradientStops(new GradientStop(Colour.Fr
187, 187), 0.101), new GradientStop(Colour.FromRgb(187, 187, 187), 0.1), new GradientStop(Colour.FromRgb(221,
204, 119), 0.101), new GradientStop(Colour.FromRgb(221, 204, 119), 0.2), new GradientStop(Colour.FromRgb(153,
153, 51), 0.201), new GradientStop(Colour.FromRgb(153, 153, 51), 0.3), new GradientStop(Colour.FromRgb(17,
119, 51), 0.301), new GradientStop(Colour.FromRgb(17, 119, 51), 0.4), new GradientStop(Colour.FromRgb(68,
170, 153), 0.401), new GradientStop(Colour.FromRgb(68, 170, 153), 0.5), new GradientStop(Colour.FromRgb(136,
204, 238), 0.501), new GradientStop(Colour.FromRgb(136, 204, 238), 0.6), new GradientStop(Colour.FromRgb(51,
34, 136), 0.601), new GradientStop(Colour.FromRgb(51, 34, 136), 0.7), new GradientStop(Colour.FromRgb(170,
68, 153), 0.701), new GradientStop(Colour.FromRgb(170, 68, 153), 0.8), new GradientStop(Colour.FromRgb(136,
34, 85), 0.801), new GradientStop(Colour.FromRgb(136, 34, 85), 0.9), new GradientStop(Colour.FromRgb(204,
102, 119), 0.901), new GradientStop(Colour.FromRgb(204, 102, 119), 1))  [static]
```

Rainbow gradient with Paul Tol's Muted palette () in discrete steps.

Definition at line 58 of file Gradients.cs.

7.58.3.7 OkabeItoRainbow

```
readonly GradientStops VectSharp.Gradients.OkabeItoRainbow = new GradientStops(new GradientStop(Colour.FromRgb
121, 167), 0), new GradientStop(Colour.FromRgb(213, 94, 0), 1.0 / 6), new GradientStop(Colour.FromRgb(230,
159, 0), 1.0 / 3), new GradientStop(Colour.FromRgb(240, 228, 66), 0.5), new GradientStop(Colour.FromRgb(0,
158, 115), 2.0 / 3), new GradientStop(Colour.FromRgb(0, 114, 178), 5.0 / 6), new GradientStop(Colour.FromRgb(8
180, 233), 1))  [static]
```

Rainbow gradient with Okabe-Ito colour-blind safe colours ().

Definition at line 43 of file Gradients.cs.

7.58.3.8 OkabeItoRainbowDiscrete

```
readonly GradientStops VectSharp.Gradients.OkabeItoRainbowDiscrete = new GradientStops(new
GradientStop(Colour.FromRgb(204, 121, 167), 0), new GradientStop(Colour.FromRgb(204, 121,
167), 0.2), new GradientStop(Colour.FromRgb(230, 159, 0), 0.201), new GradientStop(Colour.FromRgb(230,
159, 0), 0.4), new GradientStop(Colour.FromRgb(0, 158, 115), 0.401), new GradientStop(Colour.FromRgb(0,
158, 115), 0.6), new GradientStop(Colour.FromRgb(0, 114, 178), 0.601), new GradientStop(Colour.FromRgb(0,
114, 178), 0.8), new GradientStop(Colour.FromRgb(86, 180, 233), 0.801), new GradientStop(Colour.FromRgb(86,
180, 233), 1))  [static]
```

Rainbow gradient with Okabe-Ito colour-blind safe colours () in discrete steps.

Definition at line 48 of file Gradients.cs.

7.58.3.9 Plasma

```
readonly GradientStops VectSharp.Gradients.Plasma = new GradientStops(from el in Enumerable.↩
Range(0, 21) let ind = (int)Math.Round(12.75 * el) select new GradientStop(Colour.FromRgb(Plasma↩
RGB[ind, 0], PlasmaRGB[ind, 1], PlasmaRGB[ind, 2]), el * 0.05))  [static]
```

Plasma gradient, based on the homonymous colour scale included in the "viridis" R package ().

Definition at line 82 of file Gradients.cs.

7.58.3.10 Rainbow

```
readonly GradientStops VectSharp.Gradients.Rainbow = new GradientStops(new GradientStop(Colour.FromRgb(237,
28, 36), 0), new GradientStop(Colour.FromRgb(255, 127, 39), 1.0 / 6), new GradientStop(Colour.FromRgb(255,
242, 0), 1.0 / 3), new GradientStop(Colour.FromRgb(34, 177, 76), 0.5), new GradientStop(Colour.FromRgb(0,
162, 232), 2.0 / 3), new GradientStop(Colour.FromRgb(63, 72, 204), 5.0 / 6), new GradientStop(Colour.FromRgb(1
73, 164), 1))  [static]
```

Rainbow gradient (red, orange, yellow, green, blue, indigo, violet).

Definition at line 33 of file Gradients.cs.

7.58.3.11 RedToGreen

```
readonly GradientStops VectSharp.Gradients.RedToGreen = new GradientStops(new GradientStop(Colour.FromRgb(237,
28, 36), 0), new GradientStop(Colour.FromRgb(34, 177, 76), 1))  [static]
```

Gradient from red (0) to green (1).

Definition at line 28 of file Gradients.cs.

7.58.3.12 RedYellowGreen

```
readonly GradientStops VectSharp.Gradients.RedYellowGreen = new GradientStops(new GradientStop(Colour.FromRgb(
28, 36), 0), new GradientStop(Colour.FromRgb(255, 242, 0), 0.5), new GradientStop(Colour.FromRgb(34,
177, 76), 1))  [static]
```

Gradient from red (0) to yellow (0.5) to green (1).

Definition at line 38 of file Gradients.cs.

7.58.3.13 Rocket

```
readonly GradientStops VectSharp.Gradients.Rocket = new GradientStops(from el in Enumerable.↩
Range(0, 21) let ind = (int)Math.Round(12.75 * el) select new GradientStop(Colour.FromRgb(Rocket↩
RGB[ind, 0], RocketRGB[ind, 1], RocketRGB[ind, 2]), el * 0.05))  [static]
```

Rocket gradient, based on the homonymous colour scale included in the "viridis" R package ().

Definition at line 97 of file Gradients.cs.

7.58.3.14 TransparentToBlack

```
readonly GradientStops VectSharp.Gradients.TransparentToBlack = new GradientStops(new GradientStop(Colour.From
0, 0, 0), 0), new GradientStop(Colour.FromRgb(0, 0, 0), 1))  [static]
```

Gradient from transparent black (0) to opaque black (1).

Definition at line 18 of file Gradients.cs.

7.58.3.15 Turbo

```
readonly GradientStops VectSharp.Gradients.Turbo = new GradientStops(from el in Enumerable.↩
Range(0, 21) let ind = (int)Math.Round(12.75 * el) select new GradientStop(Colour.FromRgb(Turbo↩
RGB[ind, 0], TurboRGB[ind, 1], TurboRGB[ind, 2]), el * 0.05))  [static]
```

Turbo gradient, based on the homonymous colour scale included in the "viridis" R package ().

Definition at line 107 of file Gradients.cs.

7.58.3.16 Viridis

```
readonly GradientStops VectSharp.Gradients.Viridis = new GradientStops(from el in Enumerable.↩
Range(0, 21) let ind = (int)Math.Round(12.75 * el) select new GradientStop(Colour.FromRgb(Viridis↩
RGB[ind, 0], ViridisRGB[ind, 1], ViridisRGB[ind, 2]), el * 0.05))  [static]
```

Viridis gradient, based on the homonymous colour scale included in the "viridis" R package ().

Definition at line 87 of file Gradients.cs.

7.58.3.17 WhiteToBlack

```
readonly GradientStops VectSharp.Gradients.WhiteToBlack = new GradientStops(new GradientStop(Colour.FromRgb(25
255, 255), 0), new GradientStop(Colour.FromRgb(0, 0, 0), 1))  [static]
```

Gradient from white (0) to black (1).

Definition at line 23 of file Gradients.cs.

The documentation for this class was generated from the following file:

- VectSharp/Gradients.cs

7.59 VectSharp.GradientStop Struct Reference

Represents a colour stop in a gradient.

Public Member Functions

- GradientStop (Colour colour, double offset)

  Creates a new GradientStop instance.
- GradientStop MultiplyOpacity (double opacity)

  Returns a GradientStop corresponding to the current instance, whose colour's opacity has been multiplied by the specified value.

Properties

- Colour Colour [get]

  The Colour at the gradient stop.
- double Offset [get]

  The offset of the gradient stop. Range: [0, 1].

7.59.1 Detailed Description

Represents a colour stop in a gradient.

Definition at line 109 of file Brush.cs.

7.59.2 Constructor & Destructor Documentation

7.59.2.1 GradientStop()

```
VectSharp.GradientStop.GradientStop (
            Colour colour,
            double offset )
```

Creates a new GradientStop instance.

Parameters

colour	The Colour at the gradient stop.
offset	The offset of the gradient stop. Range: [0, 1].

Definition at line 126 of file Brush.cs.

7.59.3 Member Function Documentation

7.59.3.1 MultiplyOpacity()

```
GradientStop VectSharp.GradientStop.MultiplyOpacity (
            double opacity )
```

Returns a GradientStop corresponding to the current instance, whose colour's opacity has been multiplied by the specified value.

Parameters

opacity	The value that will be used to multiply the colour's opacity.

Returns

A GradientStop corresponding to the current instance, whose colour's opacity has been multiplied by the specified value.

Definition at line 137 of file Brush.cs.

7.59.4 Property Documentation

7.59.4.1 Colour

```
Colour VectSharp.GradientStop.Colour  [get]
```

The Colour at the gradient stop.

Definition at line 114 of file Brush.cs.

7.59.4.2 Offset

```
double VectSharp.GradientStop.Offset  [get]
```

The offset of the gradient stop. Range: [0, 1].

Definition at line 119 of file Brush.cs.

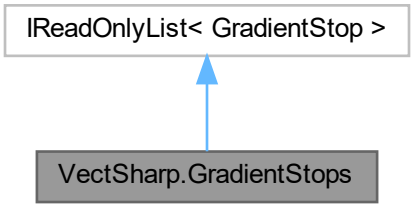
The documentation for this struct was generated from the following file:

- VectSharp/Brush.cs

7.60 VectSharp.GradientStops Class Reference

Represents a read-only list of GradientStops.

Inheritance diagram for VectSharp.GradientStops:



Public Member Functions

- IEnumerator< GradientStop > GetEnumerator ()
- GradientStops (IEnumerable< GradientStop > gradientStops)

  Creates a new GradientStops instance containing the specified gradient stops.
- GradientStops (params GradientStop[ ] gradientStops)

  Creates a new GradientStops instance containing the specified gradient stops.
- Colour GetColourAt (double position)

  Gets the colour at a certain position on the gradient.

Static Public Member Functions

- static implicit operator Func< double, Colour > (GradientStops stops)

  Convert a GradientStops object to a function that assigns a colour to values between 0 and 1.

Static Public Attributes

- static readonly double StopTolerance = 1e-7

  The minimum distance that is enforced between consecutive gradient stops.

Properties

- GradientStop this[int index] `[get]`
- int Count `[get]`

7.60.1 Detailed Description

Represents a read-only list of GradientStops.

Definition at line 146 of file Brush.cs.

7.60.2 Constructor & Destructor Documentation

7.60.2.1 GradientStops() `[1/2]`

```
VectSharp.GradientStops.GradientStops (
            IEnumerable< GradientStop > gradientStops )
```

Creates a new GradientStops instance containing the specified gradient stops.

Parameters

gradientStops	The gradient stops that will be contained in the GradientStops object.

Definition at line 176 of file Brush.cs.

7.60.2.2 GradientStops() [2/2]

```
VectSharp.GradientStops.GradientStops (
            params GradientStop[] gradientStops )
```

Creates a new GradientStops instance containing the specified gradient stops.

Parameters

gradientStops	The gradient stops that will be contained in the GradientStops object.

Definition at line 222 of file Brush.cs.

7.60.3 Member Function Documentation

7.60.3.1 GetColourAt()

```
Colour VectSharp.GradientStops.GetColourAt (
            double position )
```

Gets the colour at a certain position on the gradient.

Parameters

position	The position in the gradient (ranging from 0 to 1).

Returns

The colour of the gradient at the specified position.

Definition at line 232 of file Brush.cs.

7.60.3.2 GetEnumerator()

```
IEnumerator< GradientStop > VectSharp.GradientStops.GetEnumerator ( )
```

Definition at line 162 of file Brush.cs.

7.60.3.3 operator Func< double, Colour >()

```
static implicit VectSharp.GradientStops.operator Func< double, Colour > (
            GradientStops stops )  [static]
```

Convert a GradientStops object to a function that assigns a colour to values between 0 and 1.

Parameters

stops	The GradientStops to convert.

7.60.4 Member Data Documentation

7.60.4.1 StopTolerance

```
readonly double VectSharp.GradientStops.StopTolerance = 1e-7  [static]
```

The minimum distance that is enforced between consecutive gradient stops.

Definition at line 151 of file Brush.cs.

7.60.5 Property Documentation

7.60.5.1 Count

```
int VectSharp.GradientStops.Count  [get]
```

Definition at line 157 of file Brush.cs.

7.60.5.2 this[int index]

```
GradientStop VectSharp.GradientStops.this[int index]  [get]
```

Definition at line 154 of file Brush.cs.

The documentation for this class was generated from the following file:

- VectSharp/Brush.cs

7.61 VectSharp.Graphics Class Reference

Represents an abstract drawing surface.

Public Member Functions

- void FillPath (GraphicsPath path, Brush fillColour, string tag=null)

  Fill a GraphicsPath.
- void FillPath (GraphicsPath path, Brush fillColour, FillRule fillRule, string tag=null)

  Fill a GraphicsPath.
- void StrokePath (GraphicsPath path, Brush strokeColour, double lineWidth=1, LineCaps lineCap=LineCaps.Butt, LineJoins lineJoin=LineJoins.Miter, LineDash? lineDash=null, string tag=null)

  Stroke a GraphicsPath.
- void SetClippingPath (GraphicsPath path, string tag=null)

  Intersect the current clipping path with the specified GraphicsPath.
- void SetClippingPath (double leftX, double topY, double width, double height, string tag=null)

  Intersect the current clipping path with the specified rectangle.
- void SetClippingPath (Point topLeft, Size size, string tag=null)

  Intersect the current clipping path with the specified rectangle.
- void Rotate (double angle, string tag=null)

  Rotate the coordinate system around the origin.
- void RotateAt (double angle, Point pivot, string tag=null)

  Rotate the coordinate system around a pivot point.
- void Transform (double a, double b, double c, double d, double e, double f, string tag=null)

  Transform the coordinate system with the specified transformation matrix [[a, c, e], [b, d, f], [0, 0, 1]].
- void Translate (double x, double y, string tag=null)

  Translate the coordinate system origin.
- void Translate (Point delta, string tag=null)

  Translate the coordinate system origin.
- void Scale (double scaleX, double scaleY, string tag=null)

  Scale the coordinate system with respect to the origin.
- void FillRectangle (Point topLeft, Size size, Brush fillColour, string tag=null)

  Fill a rectangle.
- void FillRectangle (double leftX, double topY, double width, double height, Brush fillColour, string tag=null)

  Fill a rectangle.
- void StrokeRectangle (Point topLeft, Size size, Brush strokeColour, double lineWidth=1, LineCaps lineCap=LineCaps.Butt, LineJoins lineJoin=LineJoins.Miter, LineDash? lineDash=null, string tag=null)

  Stroke a rectangle.
- void StrokeRectangle (double leftX, double topY, double width, double height, Brush strokeColour, double lineWidth=1, LineCaps lineCap=LineCaps.Butt, LineJoins lineJoin=LineJoins.Miter, LineDash? lineDash=null, string tag=null)

  Stroke a rectangle.
- void DrawRasterImage (int sourceX, int sourceY, int sourceWidth, int sourceHeight, double destinationX, double destinationY, double destinationWidth, double destinationHeight, RasterImage image, string tag=null)

  Draw a raster image.
- void DrawRasterImage (double x, double y, RasterImage image, string tag=null)

  Draw a raster image.
- void DrawRasterImage (Point position, RasterImage image, string tag=null)

  Draw a raster image.
- void DrawRasterImage (double x, double y, double width, double height, RasterImage image, string tag=null)

Draw a raster image.

- void DrawRasterImage (Point position, Size size, RasterImage image, string tag=null)

  Draw a raster image.
- void Save ()

  Save the current transform state (rotation, translation, scale).
- void Restore ()

  Restore the previous transform state (rotation, translation scale).
- void CopyToIGraphicsContext (IGraphicsContext destinationContext)

  Copy the current graphics to an instance of a class implementing IGraphicsContext.
- void DrawGraphics (Point origin, Graphics graphics)

  Draws a Graphics object on the current Graphics object.
- void DrawGraphics (double originX, double originY, Graphics graphics, string tag)

  Draws a Graphics object on the current Graphics object, prepending the supplied tag to the tags contained in the Graphics object being drawn.
- void DrawGraphics (Point origin, Graphics graphics, string tag)

  Draws a Graphics object on the current Graphics object, prepending the supplied tag to the tags contained in the Graphics object being drawn.
- void DrawGraphics (double originX, double originY, Graphics graphics)

  Draws a Graphics object on the current Graphics object.
- void DrawGraphics (Point origin, Graphics graphics, IFilter filter, string tag=null)

  Draws a Graphics object on the current Graphics object, applying the specified filter .
- void DrawGraphics (double originX, double originY, Graphics graphics, IFilter filter, string tag=null)

  Draws a Graphics object on the current Graphics object, applying the specified filter .
- Graphics Transform (Func< Point, Point > transformationFunction, double linearisationResolution)

  Creates a new Graphics object in which all the graphics actions have been transformed using an arbitrary transformation function. Raster images are replaced by grey rectangles.
- Graphics Transform (Func< Point, Point > transformationFunction, double linearisationResolution, double maxSegmentLength)

  Creates a new Graphics object in which all the graphics actions have been transformed using an arbitrary transformation function. Raster images are replaced by grey rectangles.
- Graphics Linearise (double resolution)

  Creates a new Graphics object by linearising all of the elements of the current instance, i.e. replacing curve segments with series of line segments that approximate them. Raster images are left unchanged.
- Rectangle GetBounds ()

  Computes the rectangular bounds of the region affected by the drawing operations performed on the Graphics object.
- bool TryRasterise (Rectangle region, double scale, bool interpolate, out RasterImage output)

  Tries to rasterise specified region of this Graphics object using the default rasterisation method.
- void Crop (Rectangle region)

  Removes graphics actions that fall completely outside of the specified region .
- void Crop (Point topLeft, Size size)

  Removes graphics actions that fall completely outside of the specified region.
- IEnumerable< string > GetTags ()

  Gets all the tags that have been defined in the Graphics.
- void FillText (Point origin, string text, Font font, Brush fillColour, TextBaselines textBaseline=TextBaselines.↩ Top, string tag=null)

  Fill a text string.
- void FillText (double originX, double originY, string text, Font font, Brush fillColour, TextBaselines text↩ Baseline=TextBaselines.Top, string tag=null)

  Fill a text string.
- void StrokeText (Point origin, string text, Font font, Brush strokeColour, TextBaselines textBaseline=Text↩ Baselines.Top, double lineWidth=1, LineCaps lineCap=LineCaps.Butt, LineJoins lineJoin=LineJoins.Miter, LineDash? lineDash=null, string tag=null)

Stroke a text string.

- void StrokeText (double originX, double originY, string text, Font font, Brush strokeColour, TextBaselines textBaseline=TextBaselines.Top, double lineWidth=1, LineCaps lineCap=LineCaps.Butt, LineJoins lineJoin=LineJoins.Miter, LineDash? lineDash=null, string tag=null)

  Stroke a text string.
- void FillTextOnPath (GraphicsPath path, string text, Font font, Brush fillColour, double reference=0, TextAnchors anchor=TextAnchors.Left, TextBaselines textBaseline=TextBaselines.Top, string tag=null)

  Fill a text string along a GraphicsPath.
- void StrokeTextOnPath (GraphicsPath path, string text, Font font, Brush strokeColour, double reference=0, TextAnchors anchor=TextAnchors.Left, TextBaselines textBaseline=TextBaselines.Top, double lineWidth=1, LineCaps lineCap=LineCaps.Butt, LineJoins lineJoin=LineJoins.Miter, LineDash? lineDash=null, string tag=null)

  Stroke a text string along a GraphicsPath.
- void FillText (Point origin, IEnumerable< FormattedText > text, Brush fillColour, TextBaselines textBaseline=TextBaselines.Top, string tag=null)

  Fill a formatted text string.
- void FillText (double originX, double originY, IEnumerable< FormattedText > text, Brush fillColour, TextBaselines textBaseline=TextBaselines.Top, string tag=null)

  Fill a formatted text string.
- void StrokeText (Point origin, IEnumerable< FormattedText > text, Brush strokeColour, TextBaselines textBaseline=TextBaselines.Top, double lineWidth=1, LineCaps lineCap=LineCaps.Butt, LineJoins lineJoin=LineJoins.Miter, LineDash? lineDash=null, string tag=null)

  Stroke a formatted text string.
- void StrokeText (double originX, double originY, IEnumerable< FormattedText > text, Brush strokeColour, TextBaselines textBaseline=TextBaselines.Top, double lineWidth=1, LineCaps lineCap=LineCaps.Butt, LineJoins lineJoin=LineJoins.Miter, LineDash? lineDash=null, string tag=null)

  Stroke a formatted text string.
- Size MeasureText (string text, Font font)

  Measure a text string. See also

  See also

  Font.MeasureText(string), Font.MeasureTextAdvanced(string)

  and .
- Size MeasureText (IEnumerable< FormattedText > text)

  Measure a formatted text string. See also

  See also

  FormattedTextExtensions.Measure(IEnumerable<FormattedText>)

  .
- void FillTextUnderline (double originX, double originY, string text, Font font, Brush fillColour, TextBaselines textBaseline=TextBaselines.Top, string tag=null)

  Fills the underline of the specified text string.
- void FillTextUnderline (Point origin, string text, Font font, Brush fillColour, TextBaselines textBaseline=TextBaselines.Top, string tag=null)

  Fills the underline of the specified text string.
- void StrokeTextUnderline (double originX, double originY, string text, Font font, Brush strokeColour, TextBaselines textBaseline=TextBaselines.Top, double lineWidth=1, LineCaps lineCap=LineCaps.Butt, LineJoins lineJoin=LineJoins.Miter, LineDash? lineDash=null, string tag=null)

  Stroke the underline of the specified text string.
- void StrokeTextUnderline (Point origin, string text, Font font, Brush strokeColour, TextBaselines textBaseline=TextBaselines.Top, double lineWidth=1, LineCaps lineCap=LineCaps.Butt, LineJoins lineJoin=LineJoins.Miter, LineDash? lineDash=null, string tag=null)

  Stroke the underline of the specified text string.
- void FillTextUnderline (double originX, double originY, IEnumerable< FormattedText > text, Brush fillColour, TextBaselines textBaseline=TextBaselines.Top, string tag=null)

Fill the underline of the specified formatted text string.

- void FillTextUnderline (Point origin, IEnumerable< FormattedText > text, Brush fillColour, TextBaselines textBaseline=TextBaselines.Top, string tag=null)

  Fill the underline of the specified formatted text string.

- void StrokeTextUnderline (double originX, double originY, IEnumerable< FormattedText > text, Brush strokeColour, TextBaselines textBaseline=TextBaselines.Top, double lineWidth=1, LineCaps lineCap=LineCaps.Butt, LineJoins lineJoin=LineJoins.Miter, LineDash? lineDash=null, string tag=null)

  Stroke the underline of the specified formatted text string.

- void StrokeTextUnderline (Point origin, IEnumerable< FormattedText > text, Brush strokeColour, TextBaselines textBaseline=TextBaselines.Top, double lineWidth=1, LineCaps lineCap=LineCaps.Butt, LineJoins lineJoin=LineJoins.Miter, LineDash? lineDash=null, string tag=null)

  Stroke the underline of the specified formatted text string.

Static Public Attributes

- static Func< Graphics, Rectangle, double, bool, RasterImage > RasterisationMethod = null

  A method that is used to rasterise a region of a Graphics object. Set this to `null` if you wish to use the default rasterisation methods (implemented by either VectSharp.Raster, or VectSharp.Raster.ImageSharp). You will have to provide your own implementation of this method if neither VectSharp.Raster nor VectSharp.Raster.ImageSharp are referenced by your project. The first argument of this method is the Graphics to be rasterised, the second is a Rectangle representing the region to rasterise, the third is a double representing the scale, and the third is a boolean value indicating whether the resulting RasterImage should be interpolated.

Properties

- static UnbalancedStackActions UnbalancedStackAction = UnbalancedStackActions.Throw `[get, set]`

  Determines how an unbalanced graphics state stack (which occurs if the number of calls to Save and Restore is not equal) will be treated. The default is UnbalancedStackActions.Throw.

- FillRule DefaultFillRule = FillRule.NonZeroWinding `[get, set]`

  The default fill rule.

- bool UseUniqueTags = true `[get, set]`

  Determines whether unique tags should be used for graphics actions that create multiple objects (e.g. drawing text).

7.61.1 Detailed Description

Represents an abstract drawing surface.

Definition at line 278 of file Graphics.cs.

7.61.2 Member Function Documentation

7.61.2.1 CopyToIGraphicsContext()

```
void VectSharp.Graphics.CopyToIGraphicsContext (
            IGraphicsContext destinationContext )
```

Copy the current graphics to an instance of a class implementing IGraphicsContext.

Parameters

destinationContext	The IGraphicsContext on which the graphics are to be copied.

Definition at line 666 of file Graphics.cs.

7.61.2.2 Crop() [1/2]

```
void VectSharp.Graphics.Crop (
            Point topLeft,
            Size size )
```

Removes graphics actions that fall completely outside of the specified region.

Parameters

topLeft	The top-left corner of the area to preserve.
size	The size of the area to preserve.

Definition at line 1695 of file Graphics.cs.

7.61.2.3 Crop() [2/2]

```
void VectSharp.Graphics.Crop (
            Rectangle region )
```

Removes graphics actions that fall completely outside of the specified *region* .

Parameters

region	The area to preserve.

Definition at line 1606 of file Graphics.cs.

7.61.2.4 DrawGraphics() [1/6]

```
void VectSharp.Graphics.DrawGraphics (
            double originX,
            double originY,
            Graphics graphics )
```

Draws a Graphics object on the current Graphics object.

Parameters

originX	The horizontal coordinate at which to place the origin of *graphics* .
originY	The vertical coordinate at which to place the origin of *graphics* .
graphics	The Graphics object to draw on the current Graphics object.

Definition at line 950 of file Graphics.cs.

7.61.2.5 DrawGraphics() [2/6]

```
void VectSharp.Graphics.DrawGraphics (
            double originX,
            double originY,
            Graphics graphics,
            IFilter filter,
            string tag = null )
```

Draws a Graphics object on the current Graphics object, applying the specified *filter* .

Parameters

originX	The horizontal coordinate at which to place the origin of *graphics* .
originY	The vertical coordinate at which to place the origin of *graphics* .
graphics	The Graphics object to draw on the current Graphics object.
filter	An IFilter object, representing the filter to apply to the *graphics* object.
tag	A tag to identify the filter.

Definition at line 992 of file Graphics.cs.

7.61.2.6 DrawGraphics() [3/6]

```
void VectSharp.Graphics.DrawGraphics (
            double originX,
            double originY,
            Graphics graphics,
            string tag )
```

Draws a Graphics object on the current Graphics object, prepending the supplied *tag* to the tags contained in the Graphics object being drawn.

Parameters

originX	The horizontal coordinate at which to place the origin of *graphics* .
originY	The vertical coordinate at which to place the origin of *graphics* .
graphics	The Graphics object to draw on the current Graphics object.
tag	The tag to prepend to the tags contained in the *graphics* object.

Definition at line 893 of file Graphics.cs.

7.61.2.7 DrawGraphics() [4/6]

```
void VectSharp.Graphics.DrawGraphics (
            Point origin,
            Graphics graphics )
```

Draws a Graphics object on the current Graphics object.

Parameters

origin	The point at which to place the origin of *graphics* .
graphics	The Graphics object to draw on the current Graphics object.

Definition at line 874 of file Graphics.cs.

7.61.2.8 DrawGraphics() [5/6]

```
void VectSharp.Graphics.DrawGraphics (
            Point origin,
            Graphics graphics,
            IFilter filter,
            string tag = null )
```

Draws a Graphics object on the current Graphics object, applying the specified *filter* .

Parameters

origin	The point at which to place the origin of *graphics* .
graphics	The Graphics object to draw on the current Graphics object.
filter	An IFilter object, representing the filter to apply to the *graphics* object.
tag	A tag to identify the filter.

Definition at line 962 of file Graphics.cs.

7.61.2.9 DrawGraphics() [6/6]

```
void VectSharp.Graphics.DrawGraphics (
            Point origin,
            Graphics graphics,
            string tag )
```

Draws a Graphics object on the current Graphics object, prepending the supplied *tag* to the tags contained in the Graphics object being drawn.

Parameters

origin	The point at which to place the origin of *graphics* .
graphics	The Graphics object to draw on the current Graphics object.
tag	The tag to prepend to the tags contained in the *graphics* object.

Definition at line 904 of file Graphics.cs.

7.61.2.10 DrawRasterImage() [1/5]

```
void VectSharp.Graphics.DrawRasterImage (
            double x,
            double y,
            double width,
            double height,
            RasterImage image,
            string tag = null )
```

Draw a raster image.

Parameters

x	The horizontal coordinate of the top-left corner of the rectangle delimiting the destination area of the image.
y	The vertical coordinate of the top-left corner of the rectangle delimiting the destination area of the image.
width	The width of the rectangle delimiting the destination area of the image.
height	The height of the rectangle delimiting the destination area of the image.
image	The image to draw.
tag	A tag to identify the drawn image.

Definition at line 571 of file Graphics.cs.

7.61.2.11 DrawRasterImage() [2/5]

```
void VectSharp.Graphics.DrawRasterImage (
            double x,
            double y,
            RasterImage image,
            string tag = null )
```

Draw a raster image.

Parameters

x	The horizontal coordinate of the top-left corner of the rectangle delimiting the destination area of the image.
y	The vertical coordinate of the top-left corner of the rectangle delimiting the destination area of the image.
image	The image to draw.
tag	A tag to identify the drawn image.

Definition at line 546 of file Graphics.cs.

7.61.2.12 DrawRasterImage() [3/5]

```
void VectSharp.Graphics.DrawRasterImage (
            int sourceX,
            int sourceY,
            int sourceWidth,
            int sourceHeight,
            double destinationX,
            double destinationY,
            double destinationWidth,
            double destinationHeight,
            RasterImage image,
            string tag = null )
```

Draw a raster image.

Parameters

sourceX	The horizontal coordinate of the top-left corner of the rectangle delimiting the source area of the image.
sourceY	The vertical coordinate of the top-left corner of the rectangle delimiting the source area of the image.
sourceWidth	The width of the rectangle delimiting the source area of the image.
sourceHeight	The height of the rectangle delimiting the source area of the image.
destinationX	The horizontal coordinate of the top-left corner of the rectangle delimiting the destination area of the image.
destinationY	The vertical coordinate of the top-left corner of the rectangle delimiting the destination area of the image.
destinationWidth	The width of the rectangle delimiting the destination area of the image.
destinationHeight	The height of the rectangle delimiting the destination area of the image.
image	The image to draw.
tag	A tag to identify the drawn image.

Definition at line 534 of file Graphics.cs.

7.61.2.13 DrawRasterImage() [4/5]

```
void VectSharp.Graphics.DrawRasterImage (
            Point position,
            RasterImage image,
            string tag = null )
```

Draw a raster image.

Parameters

position	The the top-left corner of the rectangle delimiting the destination area of the image.
image	The image to draw.
tag	A tag to identify the drawn image.

Definition at line 557 of file Graphics.cs.

7.61.2.14 DrawRasterImage() [5/5]

```
void VectSharp.Graphics.DrawRasterImage (
            Point position,
            Size size,
            RasterImage image,
            string tag = null )
```

Draw a raster image.

Parameters

position	The the top-left corner of the rectangle delimiting the destination area of the image.
size	The size of the rectangle delimiting the destination area of the image.
image	The image to draw.
tag	A tag to identify the drawn image.

Definition at line 583 of file Graphics.cs.

7.61.2.15 FillPath() [1/2]

```
void VectSharp.Graphics.FillPath (
            GraphicsPath path,
            Brush fillColour,
            FillRule fillRule,
            string tag = null )
```

Fill a GraphicsPath.

Parameters

path	The GraphicsPath to fill.
fillColour	The Brush with which to fill the GraphicsPath.
fillRule	The FillRule that determines which parts of the path are filled.
tag	A tag to identify the filled path.

Definition at line 310 of file Graphics.cs.

7.61.2.16 FillPath() [2/2]

```
void VectSharp.Graphics.FillPath (
            GraphicsPath path,
            Brush fillColour,
            string tag = null )
```

Fill a GraphicsPath.

Parameters

path	The GraphicsPath to fill.
fillColour	The Brush with which to fill the GraphicsPath.
tag	A tag to identify the filled path.

Definition at line 298 of file Graphics.cs.

7.61.2.17 FillRectangle() [1/2]

```
void VectSharp.Graphics.FillRectangle (
            double leftX,
            double topY,
            double width,
            double height,
            Brush fillColour,
            string tag = null )
```

Fill a rectangle.

Parameters

leftX	The horizontal coordinate of the top-left corner of the rectangle.
topY	The vertical coordinate of the top-left corner of the rectangle.
width	The width of the rectangle.
height	The height of the rectangle.
fillColour	The colour with which to fill the rectangle.
tag	A tag to identify the filled rectangle.

Definition at line 482 of file Graphics.cs.

7.61.2.18 FillRectangle() [2/2]

```
void VectSharp.Graphics.FillRectangle (
            Point topLeft,
            Size size,
            Brush fillColour,
            string tag = null )
```

Fill a rectangle.

Parameters

topLeft	The top-left corner of the rectangle.
size	The size of the rectangle.
fillColour	The colour with which to fill the rectangle.
tag	A tag to identify the filled rectangle.

Definition at line 468 of file Graphics.cs.

7.61.2.19 FillText() [1/4]

```
void VectSharp.Graphics.FillText (
            double originX,
            double originY,
            IEnumerable< FormattedText > text,
            Brush fillColour,
            TextBaselines textBaseline = TextBaselines.Top,
            string tag = null )
```

Fill a formatted text string.

Parameters

originX	The horizontal coordinate of the text origin.
originY	The vertical coordinate of the text origin. See *textBaseline* .
text	The FormattedText to draw.
fillColour	The default Brush to use to fill the text. This can be overridden by each *text* element.
textBaseline	The text baseline (determines what *originY* represents).
tag	A tag to identify the filled text.

Definition at line 512 of file Graphics.Text.cs.

7.61.2.20 FillText() [2/4]

```
void VectSharp.Graphics.FillText (
            double originX,
            double originY,
            string text,
            Font font,
            Brush fillColour,
            TextBaselines textBaseline = TextBaselines.Top,
            string tag = null )
```

Fill a text string.

Parameters

originX	The horizontal coordinate of the text origin.
originY	The vertical coordinate of the text origin. See *textBaseline* .
text	The string to draw.
font	The font with which to draw the text.
fillColour	The Brush to use to fill the text.
textBaseline	The text baseline (determines what *originY* represents).
tag	A tag to identify the filled text.

Definition at line 57 of file Graphics.Text.cs.

7.61.2.21 FillText() [3/4]

```
void VectSharp.Graphics.FillText (
            Point origin,
            IEnumerable< FormattedText > text,
            Brush fillColour,
            TextBaselines textBaseline = TextBaselines.Top,
            string tag = null )
```

Fill a formatted text string.

Parameters

origin	The text origin. See *textBaseline* .
text	The FormattedText to draw.
fillColour	The default Brush to use to fill the text. This can be overridden by each *text* element.
textBaseline	The text baseline (determines what the vertical component of *origin* represents).
tag	A tag to identify the filled text.

Definition at line 411 of file Graphics.Text.cs.

7.61.2.22 FillText() [4/4]

```
void VectSharp.Graphics.FillText (
            Point origin,
            string text,
            Font font,
            Brush fillColour,
            TextBaselines textBaseline = TextBaselines.Top,
            string tag = null )
```

Fill a text string.

Parameters

origin	The text origin. See *textBaseline* .
text	The string to draw.
font	The font with which to draw the text.
fillColour	The Brush to use to fill the text.
textBaseline	The text baseline (determines what the vertical component of *origin* represents).
tag	A tag to identify the filled text.

Definition at line 34 of file Graphics.Text.cs.

7.61.2.23 FillTextOnPath()

```
void VectSharp.Graphics.FillTextOnPath (
            GraphicsPath path,
            string text,
            Font font,
            Brush fillColour,
            double reference = 0,
            TextAnchors anchor = TextAnchors.Left,
            TextBaselines textBaseline = TextBaselines.Top,
            string tag = null )
```

Fill a text string along a GraphicsPath.

Parameters

path	The GraphicsPath along which the text will flow.
text	The string to draw.
font	The font with which to draw the text.
fillColour	The Brush to use to fill the text.
reference	The (relative) starting point on the path starting from which the text should be drawn (0 is the start of the path, 1 is the end of the path).
anchor	The anchor in the text string that will correspond to the point specified by the *reference* .
textBaseline	The text baseline (determines which the position of the text in relation to the *path* .
tag	A tag to identify the filled text.

Definition at line 134 of file Graphics.Text.cs.

7.61.2.24 FillTextUnderline() [1/4]

```
void VectSharp.Graphics.FillTextUnderline (
            double originX,
            double originY,
            IEnumerable< FormattedText > text,
            Brush fillColour,
            TextBaselines textBaseline = TextBaselines.Top,
            string tag = null )
```

Fill the underline of the specified formatted text string.

Parameters

originX	The horizontal coordinate of the text origin.
originY	The vertical coordinate of the text origin. See *textBaseline* .
text	The FormattedText whose underline will be drawn.
fillColour	The default Brush to use to fill the underline. This can be overridden by each *text* element.
textBaseline	The text baseline (determines what *originY* represents).
tag	A tag to identify the filled underlined.

Definition at line 754 of file Graphics.Text.cs.

7.61.2.25 FillTextUnderline() [2/4]

```
void VectSharp.Graphics.FillTextUnderline (
            double originX,
            double originY,
            string text,
            Font font,
            Brush fillColour,
            TextBaselines textBaseline = TextBaselines.Top,
            string tag = null )
```

Fills the underline of the specified text string.

Parameters

originX	The horizontal coordinate of the text origin.
originY	The vertical coordinate of the text origin. See *textBaseline* .
text	The string whose underline will be draw.
font	The font with which to draw the text.
fillColour	The Brush to use to fill the underline.
textBaseline	The text baseline (determines what *originY* represents).
tag	A tag to identify the filled underline.

Definition at line 680 of file Graphics.Text.cs.

7.61.2.26 FillTextUnderline() [3/4]

```
void VectSharp.Graphics.FillTextUnderline (
            Point origin,
            IEnumerable< FormattedText > text,
            Brush fillColour,
            TextBaselines textBaseline = TextBaselines.Top,
            string tag = null )
```

Fill the underline of the specified formatted text string.

Parameters

origin	The text origin. See *textBaseline* .
text	The FormattedText whose underline will be drawn.
fillColour	The default Brush to use to fill the underline. This can be overridden by each *text* element.
textBaseline	The text baseline (determines what the vertical component of *origin* represents).
tag	A tag to identify the filled underlined.

Definition at line 767 of file Graphics.Text.cs.

7.61.2.27 FillTextUnderline() [4/4]

```
void VectSharp.Graphics.FillTextUnderline (
            Point origin,
            string text,
            Font font,
            Brush fillColour,
            TextBaselines textBaseline = TextBaselines.Top,
            string tag = null )
```

Fills the underline of the specified text string.

Parameters

origin	The text origin. See *textBaseline* .
text	The string whose underline will be draw.
font	The font with which to draw the text.
fillColour	The Brush to use to fill the underline.
textBaseline	The text baseline (determines what the vertical component of *origin* represents).
tag	A tag to identify the filled underline.

Definition at line 694 of file Graphics.Text.cs.

7.61.2.28 GetBounds()

```
Rectangle VectSharp.Graphics.GetBounds ( )
```

Computes the rectangular bounds of the region affected by the drawing operations performed on the Graphics object.

Returns

The smallest rectangle that contains all the elements drawn on the Graphics.

Definition at line 1453 of file Graphics.cs.

7.61.2.29 GetTags()

```
IEnumerable< string > VectSharp.Graphics.GetTags ( )
```

Gets all the tags that have been defined in the Graphics.

Returns

An IEnumerable<T> of strings that, when enumerated, returns all the tags that have been defined in the Graphics.

Definition at line 1705 of file Graphics.cs.

7.61.2.30 Linearise()

```
Graphics VectSharp.Graphics.Linearise (
            double resolution )
```

Creates a new Graphics object by linearising all of the elements of the current instance, i.e. replacing curve segments with series of line segments that approximate them. Raster images are left unchanged.

Parameters

resolution	The resolution that will be used to linearise curve segments.

Returns

A new Graphics object containing the linearised elements.

Definition at line 1397 of file Graphics.cs.

7.61.2.31 MeasureText() [1/2]

```
Size VectSharp.Graphics.MeasureText (
            IEnumerable< FormattedText > text )
```

Measure a formatted text string. See also

See also

FormattedTextExtensions.Measure(IEnumerable<FormattedText>)

.

Parameters

text	The collection of FormattedText objects to measure.

Returns

The size of the measured *text* .

Definition at line 663 of file Graphics.Text.cs.

7.61.2.32 MeasureText() [2/2]

```
Size VectSharp.Graphics.MeasureText (
            string text,
            Font font )
```

Measure a text string. See also

See also

Font.MeasureText(string), Font.MeasureTextAdvanced(string)

and .

Parameters

text	The string to measure.
font	The font to use to measure the string.

Returns

The size of the measured *text* .

Definition at line 645 of file Graphics.Text.cs.

7.61.2.33 Restore()

```
void VectSharp.Graphics.Restore ( )
```

Restore the previous transform state (rotation, translation scale).

Definition at line 599 of file Graphics.cs.

7.61.2.34 Rotate()

```
void VectSharp.Graphics.Rotate (
            double angle,
            string tag = null )
```

Rotate the coordinate system around the origin.

Parameters

angle	The angle (in radians) by which to rotate the coordinate system.
tag	A tag to identify the transform.

Definition at line 374 of file Graphics.cs.

7.61.2.35 RotateAt()

```
void VectSharp.Graphics.RotateAt (
            double angle,
            Point pivot,
            string tag = null )
```

Rotate the coordinate system around a pivot point.

Parameters

angle	The angle (in radians) by which to rotate the coordinate system.
pivot	The pivot around which the coordinate system is to be rotated.
tag	A tag to identify the transform.

Definition at line 385 of file Graphics.cs.

7.61.2.36 Save()

```
void VectSharp.Graphics.Save ( )
```

Save the current transform state (rotation, translation, scale).

Definition at line 591 of file Graphics.cs.

7.61.2.37 Scale()

```
void VectSharp.Graphics.Scale (
            double scaleX,
            double scaleY,
            string tag = null )
```

Scale the coordinate system with respect to the origin.

Parameters

scaleX	The horizontal scale.
scaleY	The vertical scale.
tag	A tag to identify the transform.

Definition at line 456 of file Graphics.cs.

7.61.2.38 SetClippingPath() [1/3]

```
void VectSharp.Graphics.SetClippingPath (
            double leftX,
            double topY,
            double width,
            double height,
            string tag = null )
```

Intersect the current clipping path with the specified rectangle.

Parameters

leftX	The horizontal coordinate of the top-left corner of the rectangle.
topY	The vertical coordinate of the top-left corner of the rectangle.
width	The width of the rectangle.
height	The height of the rectangle.
tag	A tag to identify the clipping path.

Definition at line 353 of file Graphics.cs.

7.61.2.39 SetClippingPath() [2/3]

```
void VectSharp.Graphics.SetClippingPath (
```

```
            GraphicsPath path,
            string tag = null )
```

Intersect the current clipping path with the specified GraphicsPath.

Parameters

path	The GraphicsPath to intersect with the current clipping path.
tag	A tag to identify the clipping path.

Definition at line 340 of file Graphics.cs.

7.61.2.40 SetClippingPath() [3/3]

```
void VectSharp.Graphics.SetClippingPath (
            Point topLeft,
            Size size,
            string tag = null )
```

Intersect the current clipping path with the specified rectangle.

Parameters

topLeft	The top-left corner of the rectangle.
size	The size of the rectangle.
tag	A tag to identify the clipping path.

Definition at line 364 of file Graphics.cs.

7.61.2.41 StrokePath()

```
void VectSharp.Graphics.StrokePath (
            GraphicsPath path,
            Brush strokeColour,
            double lineWidth = 1,
            LineCaps lineCap = LineCaps.Butt,
            LineJoins lineJoin = LineJoins.Miter,
            LineDash?  lineDash = null,
            string tag = null )
```

Stroke a GraphicsPath.

Parameters

path	The GraphicsPath to stroke.
strokeColour	The Brush with which to stroke the GraphicsPath.
lineWidth	The width of the line with which the path is stroked.

Parameters

lineCap	The line cap to use to stroke the path.
lineJoin	The line join to use to stroke the path.
lineDash	The line dash to use to stroke the path.
tag	A tag to identify the stroked path.

Definition at line 330 of file Graphics.cs.

7.61.2.42 StrokeRectangle() [1/2]

```
void VectSharp.Graphics.StrokeRectangle (
            double leftX,
            double topY,
            double width,
            double height,
            Brush strokeColour,
            double lineWidth = 1,
            LineCaps lineCap = LineCaps.Butt,
            LineJoins lineJoin = LineJoins.Miter,
            LineDash?  lineDash = null,
            string tag = null )
```

Stroke a rectangle.

Parameters

leftX	The horizontal coordinate of the top-left corner of the rectangle.
topY	The vertical coordinate of the top-left corner of the rectangle.
width	The width of the rectangle.
height	The height of the rectangle.
strokeColour	The colour with which to stroke the rectangle.
lineWidth	The width of the line with which the rectangle is stroked.
lineCap	The line cap to use to stroke the rectangle.
lineJoin	The line join to use to stroke the rectangle.
lineDash	The line dash to use to stroke the rectangle.
tag	A tag to identify the filled rectangle.

Definition at line 516 of file Graphics.cs.

7.61.2.43 StrokeRectangle() [2/2]

```
void VectSharp.Graphics.StrokeRectangle (
            Point topLeft,
            Size size,
```

```
            Brush strokeColour,
            double lineWidth = 1,
            LineCaps lineCap = LineCaps.Butt,
            LineJoins lineJoin = LineJoins.Miter,
            LineDash?  lineDash = null,
            string tag = null )
```

Stroke a rectangle.

Parameters

topLeft	The top-left corner of the rectangle.
size	The size of the rectangle.
strokeColour	The colour with which to stroke the rectangle.
lineWidth	The width of the line with which the rectangle is stroked.
lineCap	The line cap to use to stroke the rectangle.
lineJoin	The line join to use to stroke the rectangle.
lineDash	The line dash to use to stroke the rectangle.
tag	A tag to identify the filled rectangle.

Definition at line 498 of file Graphics.cs.

7.61.2.44 StrokeText() [1/4]

```
void VectSharp.Graphics.StrokeText (
            double originX,
            double originY,
            IEnumerable< FormattedText > text,
            Brush strokeColour,
            TextBaselines textBaseline = TextBaselines.Top,
            double lineWidth = 1,
            LineCaps lineCap = LineCaps.Butt,
            LineJoins lineJoin = LineJoins.Miter,
            LineDash?  lineDash = null,
            string tag = null )
```

Stroke a formatted text string.

Parameters

originX	The horizontal coordinate of the text origin.
originY	The vertical coordinate of the text origin. See *textBaseline* .
text	The FormattedText to draw.
strokeColour	The default Brush with which to stroke the text.
lineWidth	The width of the line with which the text is stroked.
lineCap	The line cap to use to stroke the text.
lineJoin	The line join to use to stroke the text.
lineDash	The line dash to use to stroke the text.
textBaseline	The text baseline (determines what *originY* represents).
tag	A tag to identify the stroked text.

Definition at line 633 of file Graphics.Text.cs.

7.61.2.45 StrokeText() [2/4]

```
void VectSharp.Graphics.StrokeText (
            double originX,
            double originY,
            string text,
            Font font,
            Brush strokeColour,
            TextBaselines textBaseline = TextBaselines.Top,
            double lineWidth = 1,
            LineCaps lineCap = LineCaps.Butt,
            LineJoins lineJoin = LineJoins.Miter,
            LineDash?  lineDash = null,
            string tag = null )
```

Stroke a text string.

Parameters

originX	The horizontal coordinate of the text origin.
originY	The vertical coordinate of the text origin. See *textBaseline* .
text	The string to draw.
font	The font with which to draw the text.
strokeColour	The Brush with which to stroke the text.
lineWidth	The width of the line with which the text is stroked.
lineCap	The line cap to use to stroke the text.
lineJoin	The line join to use to stroke the text.
lineDash	The line dash to use to stroke the text.
textBaseline	The text baseline (determines what *originY* represents).
tag	A tag to identify the stroked text.

Definition at line 110 of file Graphics.Text.cs.

7.61.2.46 StrokeText() [3/4]

```
void VectSharp.Graphics.StrokeText (
            Point origin,
            IEnumerable< FormattedText > text,
            Brush strokeColour,
            TextBaselines textBaseline = TextBaselines.Top,
            double lineWidth = 1,
            LineCaps lineCap = LineCaps.Butt,
            LineJoins lineJoin = LineJoins.Miter,
            LineDash?  lineDash = null,
            string tag = null )
```

Stroke a formatted text string.

Parameters

origin	The text origin. See *textBaseline* .
text	The FormattedText to draw.
strokeColour	The default Brush with which to stroke the text.
lineWidth	The width of the line with which the text is stroked.
lineCap	The line cap to use to stroke the text.
lineJoin	The line join to use to stroke the text.
lineDash	The line dash to use to stroke the text.
textBaseline	The text baseline (determines what the vertical component of *origin* represents).
tag	A tag to identify the stroked text.

Definition at line 529 of file Graphics.Text.cs.

7.61.2.47 StrokeText() [4/4]

```
void VectSharp.Graphics.StrokeText (
            Point origin,
            string text,
            Font font,
            Brush strokeColour,
            TextBaselines textBaseline = TextBaselines.Top,
            double lineWidth = 1,
            LineCaps lineCap = LineCaps.Butt,
            LineJoins lineJoin = LineJoins.Miter,
            LineDash?  lineDash = null,
            string tag = null )
```

Stroke a text string.

Parameters

origin	The text origin. See *textBaseline* .
text	The string to draw.
font	The font with which to draw the text.
strokeColour	The Brush with which to stroke the text.
lineWidth	The width of the line with which the text is stroked.
lineCap	The line cap to use to stroke the text.
lineJoin	The line join to use to stroke the text.
lineDash	The line dash to use to stroke the text.
textBaseline	The text baseline (determines what the vertical component of *origin* represents).
tag	A tag to identify the stroked text.

Definition at line 83 of file Graphics.Text.cs.

7.61.2.48 StrokeTextOnPath()

```
void VectSharp.Graphics.StrokeTextOnPath (
            GraphicsPath path,
            string text,
            Font font,
            Brush strokeColour,
            double reference = 0,
            TextAnchors anchor = TextAnchors.Left,
            TextBaselines textBaseline = TextBaselines.Top,
            double lineWidth = 1,
            LineCaps lineCap = LineCaps.Butt,
            LineJoins lineJoin = LineJoins.Miter,
            LineDash?  lineDash = null,
            string tag = null )
```

Stroke a text string along a GraphicsPath.

Parameters

path	The GraphicsPath along which the text will flow.
text	The string to draw.
font	The font with which to draw the text.
strokeColour	The Brush with which to stroke the text.
lineWidth	The width of the line with which the text is stroked.
lineCap	The line cap to use to stroke the text.
lineJoin	The line join to use to stroke the text.
lineDash	The line dash to use to stroke the text.
reference	The (relative) starting point on the path starting from which the text should be drawn (0 is the start of the path, 1 is the end of the path).
anchor	The anchor in the text string that will correspond to the point specified by the *reference* .
textBaseline	The text baseline (determines which the position of the text in relation to the *path* .
tag	A tag to identify the stroked text.

7.61.2.49 StrokeTextUnderline() [1/4]

```
void VectSharp.Graphics.StrokeTextUnderline (
            double originX,
            double originY,
            IEnumerable< FormattedText > text,
            Brush strokeColour,
            TextBaselines textBaseline = TextBaselines.Top,
            double lineWidth = 1,
            LineCaps lineCap = LineCaps.Butt,
            LineJoins lineJoin = LineJoins.Miter,
            LineDash?  lineDash = null,
            string tag = null )
```

Stroke the underline of the specified formatted text string.

Parameters

originX	The horizontal coordinate of the text origin.
originY	The vertical coordinate of the text origin. See *textBaseline* .
text	The FormattedText to draw.
strokeColour	The default Brush with which to stroke the underline.
lineWidth	The width of the line with which the underline is stroked.
lineCap	The line cap to use to stroke the underline.
lineJoin	The line join to use to stroke the underline.
lineDash	The line dash to use to stroke the underline.
textBaseline	The text baseline (determines what *originY* represents).
tag	A tag to identify the stroked underline.

Definition at line 874 of file Graphics.Text.cs.

7.61.2.50 StrokeTextUnderline() [2/4]

```
void VectSharp.Graphics.StrokeTextUnderline (
            double originX,
            double originY,
            string text,
            Font font,
            Brush strokeColour,
            TextBaselines textBaseline = TextBaselines.Top,
            double lineWidth = 1,
            LineCaps lineCap = LineCaps.Butt,
            LineJoins lineJoin = LineJoins.Miter,
            LineDash?  lineDash = null,
            string tag = null )
```

Stroke the underline of the specified text string.

Parameters

originX	The horizontal coordinate of the text origin.
originY	The vertical coordinate of the text origin. See *textBaseline* .
text	The string whose underline will be drawn.
font	The font with which to draw the text.
strokeColour	The Brush with which to stroke the underline.
lineWidth	The width of the line with which the underline is stroked.
lineCap	The line cap to use to stroke the underline.
lineJoin	The line join to use to stroke the underline.
lineDash	The line dash to use to stroke the underline.
textBaseline	The text baseline (determines what *originY* represents).
tag	A tag to identify the stroked underline.

Definition at line 717 of file Graphics.Text.cs.

7.61.2.51 StrokeTextUnderline() [3/4]

```
void VectSharp.Graphics.StrokeTextUnderline (
            Point origin,
            IEnumerable< FormattedText > text,
            Brush strokeColour,

            double lineWidth = 1,
            LineCaps lineCap = LineCaps.Butt,
            LineJoins lineJoin = LineJoins.Miter,
            LineDash?  lineDash = null,
            string tag = null )
```

Stroke the underline of the specified formatted text string.

Parameters

origin	The text origin. See *textBaseline* .
text	The FormattedText to draw.
strokeColour	The default Brush with which to stroke the underline.
lineWidth	The width of the line with which the underline is stroked.
lineCap	The line cap to use to stroke the underline.
lineJoin	The line join to use to stroke the underline.
lineDash	The line dash to use to stroke the underline.
textBaseline	The text baseline (determines what the vertical component of *origin* represents).
tag	A tag to identify the stroked underline.

Definition at line 891 of file Graphics.Text.cs.

7.61.2.52 StrokeTextUnderline() [4/4]

```
void VectSharp.Graphics.StrokeTextUnderline (
            Point origin,
            string text,
            Font font,
            Brush strokeColour,
            TextBaselines textBaseline = TextBaselines.Top,
            double lineWidth = 1,
            LineCaps lineCap = LineCaps.Butt,
            LineJoins lineJoin = LineJoins.Miter,
            LineDash?  lineDash = null,
            string tag = null )
```

Stroke the underline of the specified text string.

Parameters

origin	The text origin. See *textBaseline* .
text	The string whose underline will be drawn.
font	The font with which to draw the text.
strokeColour	The Brush with which to stroke the underline.

Parameters

lineWidth	The width of the line with which the underline is stroked.
lineCap	The line cap to use to stroke the underline.
lineJoin	The line join to use to stroke the underline.
lineDash	The line dash to use to stroke the underline.
textBaseline	The text baseline (determines what the vertical component of *origin* represents).
tag	A tag to identify the stroked underline.

Definition at line 735 of file Graphics.Text.cs.

7.61.2.53 Transform() [1/3]

```
void VectSharp.Graphics.Transform (
            double a,
            double b,
            double c,
            double d,
            double e,
            double f,
            string tag = null )
```

Transform the coordinate system with the specified transformation matrix [[a, c, e], [b, d, f], [0, 0, 1]].

Parameters

a	The first element of the first column.
b	The second element of the first column.
c	The first element of the second column.
d	The second element of the second column.
e	The first element of the third column.
f	The second element of the third column.
tag	A tag to identify the transform.

Definition at line 423 of file Graphics.cs.

7.61.2.54 Transform() [2/3]

```
Graphics VectSharp.Graphics.Transform (
            Func< Point, Point > transformationFunction,
            double linearisationResolution )
```

Creates a new Graphics object in which all the graphics actions have been transformed using an arbitrary transformation function. Raster images are replaced by grey rectangles.

Parameters

transformationFunction	An arbitrary transformation function.
linearisationResolution	The resolution that will be used to linearise curve segments.

Returns

A new Graphics object in which all graphics actions have been linearised and transformed using the *transformationFunction* .

Definition at line 1070 of file Graphics.cs.

7.61.2.55 Transform() [3/3]

```
Graphics VectSharp.Graphics.Transform (
            Func< Point, Point > transformationFunction,
            double linearisationResolution,
            double maxSegmentLength )
```

Creates a new Graphics object in which all the graphics actions have been transformed using an arbitrary transformation function. Raster images are replaced by grey rectangles.

Parameters

transformationFunction	An arbitrary transformation function.
linearisationResolution	The resolution that will be used to linearise curve segments.
maxSegmentLength	The maximum length of line segments.

Returns

A new Graphics object in which all graphics actions have been linearised and transformed using the *transformationFunction* .

Definition at line 1268 of file Graphics.cs.

7.61.2.56 Translate() [1/2]

```
void VectSharp.Graphics.Translate (
            double x,
            double y,
            string tag = null )
```

Translate the coordinate system origin.

Parameters

x	The horizontal translation.
y	The vertical translation.
tag	A tag to identify the transform.

Definition at line 435 of file Graphics.cs.

7.61.2.57 Translate() [2/2]

```
void VectSharp.Graphics.Translate (
            Point delta,
            string tag = null )
```

Translate the coordinate system origin.

Parameters

delta	The new origin point.
tag	A tag to identify the transform.

Definition at line 445 of file Graphics.cs.

7.61.2.58 TryRasterise()

```
bool VectSharp.Graphics.TryRasterise (
            Rectangle region,
            double scale,
            bool interpolate,
            out RasterImage output )
```

Tries to rasterise specified region of this Graphics object using the default rasterisation method.

Parameters

region	The region of the Graphics to rasterise.
scale	The scale at which the image is rasterised.
interpolate	Determines whether the resulting RasterImage should be interpolated or not.
output	When this method returns, this will contain the rasterised image (or `null` if the image could not be rasterised.

Returns

`true` if the image could be rasterised; `false` if it could not be rasterised.

Definition at line 1561 of file Graphics.cs.

7.61.3 Member Data Documentation

7.61.3.1 RasterisationMethod

```
Func<Graphics, Rectangle, double, bool, RasterImage> VectSharp.Graphics.RasterisationMethod =
null  [static]
```

A method that is used to rasterise a region of a Graphics object. Set this to `null` if you wish to use the default rasterisation methods (implemented by either VectSharp.Raster, or VectSharp.Raster.ImageSharp). You will have to provide your own implementation of this method if neither VectSharp.Raster nor VectSharp.Raster.ImageSharp are referenced by your project. The first argument of this method is the Graphics to be rasterised, the second is a Rectangle representing the region to rasterise, the third is a double representing the scale, and the third is a boolean value indicating whether the resulting RasterImage should be interpolated.

Definition at line 1551 of file Graphics.cs.

7.61.4 Property Documentation

7.61.4.1 DefaultFillRule

```
FillRule VectSharp.Graphics.DefaultFillRule = FillRule.NonZeroWinding  [get], [set]
```

The default fill rule.

Definition at line 290 of file Graphics.cs.

7.61.4.2 UnbalancedStackAction

```
UnbalancedStackActions VectSharp.Graphics.UnbalancedStackAction = UnbalancedStackActions.Throw
[static], [get], [set]
```

Determines how an unbalanced graphics state stack (which occurs if the number of calls to Save and Restore is not equal) will be treated. The default is UnbalancedStackActions.Throw.

Definition at line 283 of file Graphics.cs.

7.61.4.3 UseUniqueTags

```
bool VectSharp.Graphics.UseUniqueTags = true  [get], [set]
```

Determines whether unique tags should be used for graphics actions that create multiple objects (e.g. drawing text).

Definition at line 318 of file Graphics.cs.

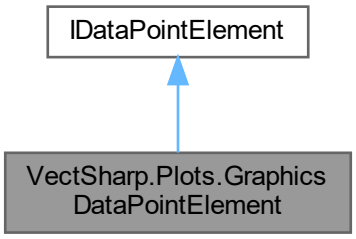
The documentation for this class was generated from the following files:

- VectSharp/Graphics.cs
- VectSharp/Graphics.Text.cs

7.62 VectSharp.Plots.GraphicsDataPointElement Class Reference

A symbol defined by a VectSharp.Graphics object.

Inheritance diagram for VectSharp.Plots.GraphicsDataPointElement:



Public Member Functions

- void Plot (Graphics target, PlotElementPresentationAttributes presentationAttributes, string tag)

  Draw the symbol on the plot.

Parameters

target	*The Graphics object on which to draw. It is assumed that it has been transformed so that the symbol can be drawn centred at (0, 0)*
presentationAttributes	*Presentation attributes determining the appearance of the symbol.*
tag	*A tag to identify the symbol in the plot.*

- GraphicsDataPointElement (Graphics graphics)

  Creates a new GraphicsDataPointElement instance.

Properties

- Graphics Graphics `[get, set]`

  The VectSharp.Graphics object that will be copied on the plot.

7.62.1 Detailed Description

A symbol defined by a VectSharp.Graphics object.

Definition at line 96 of file DataPoints.cs.

7.62.2 Constructor & Destructor Documentation

7.62.2.1 GraphicsDataPointElement()

```
VectSharp.Plots.GraphicsDataPointElement.GraphicsDataPointElement (
            Graphics graphics )
```

Creates a new GraphicsDataPointElement instance.

Parameters

graphics	

Definition at line 113 of file DataPoints.cs.

7.62.3 Member Function Documentation

7.62.3.1 Plot()

```
void VectSharp.Plots.GraphicsDataPointElement.Plot (
            Graphics target,
            PlotElementPresentationAttributes presentationAttributes,
            string tag )
```

Draw the symbol on the plot.

Parameters

target	The Graphics object on which to draw. It is assumed that it has been transformed so that the symbol can be drawn centred at (0, 0)
presentationAttributes	Presentation attributes determining the appearance of the symbol.
tag	A tag to identify the symbol in the plot.

Implements VectSharp.Plots.IDataPointElement.

Definition at line 104 of file DataPoints.cs.

7.62.4 Property Documentation

7.62.4.1 Graphics

```
Graphics VectSharp.Plots.GraphicsDataPointElement.Graphics  [get], [set]
```

The VectSharp.Graphics object that will be copied on the plot.

Definition at line 101 of file DataPoints.cs.

The documentation for this class was generated from the following file:

- VectSharp.Plots/DataPoints.cs

7.63 VectSharp.GraphicsPath Class Reference

Represents a graphics path that can be filled or stroked.

Public Member Functions

- GraphicsPath MoveTo (Point p)

  Move the current point without tracing a segment from the previous point.
- GraphicsPath MoveTo (double x, double y)

  Move the current point without tracing a segment from the previous point.
- GraphicsPath LineTo (Point p)

  Move the current point and trace a segment from the previous point.
- GraphicsPath LineTo (double x, double y)

  Move the current point and trace a segment from the previous point.
- GraphicsPath Arc (Point center, double radius, double startAngle, double endAngle)

  Trace an arc segment from a circle with the specified center and radius , starting at startAngle and ending at endAngle . The current point is updated to the end point of the arc.
- GraphicsPath Arc (double centerX, double centerY, double radius, double startAngle, double endAngle)

  Trace an arc segment from a circle with the specified center and radius , starting at startAngle and ending at endAngle . The current point is updated to the end point of the arc.
- GraphicsPath EllipticalArc (double radiusX, double radiusY, double axisAngle, bool largeArc, bool sweep↩ Clockwise, Point endPoint)

  Trace an arc from an ellipse with the specified radii, rotated by axisAngle with respect to the x-axis, starting at the current point and ending at the endPoint .
- GraphicsPath CubicBezierTo (Point control1, Point control2, Point endPoint)

  Trace a cubic Bezier curve from the current point to a destination point, with two control points. The current point is updated to the end point of the Bezier curve.

- GraphicsPath CubicBezierTo (double control1X, double control1Y, double control2X, double control2Y, double endPointX, double endPointY)

  Trace a cubic Bezier curve from the current point to a destination point, with two control points. The current point is updated to the end point of the Bezier curve.
- GraphicsPath QuadraticBezierTo (Point control, Point endPoint)

  Trace a quadratic Bezier curve from the current point to a destination point, with a single control point. The current point is updated to the end point of the Bezier curve.
- GraphicsPath QuadraticBezierTo (double controlX, double controlY, double endPointX, double endPointY)

  Trace a quadratic Bezier curve from the current point to a destination point, with a single control point. The current point is updated to the end point of the Bezier curve.
- GraphicsPath Close ()

  Trace a segment from the current point to the start point of the figure and flag the figure as closed.
- GraphicsPath AddText (double originX, double originY, string text, Font font, TextBaselines textBaseline=TextBaselines.Top)

  Add the contour of a text string to the current path.
- GraphicsPath AddText (Point origin, string text, Font font, TextBaselines textBaseline=TextBaselines.Top)

  Add the contour of a text string to the current path.
- GraphicsPath AddTextOnPath (GraphicsPath path, string text, Font font, double reference=0, TextAnchors anchor=TextAnchors.Left, TextBaselines textBaseline=TextBaselines.Top)

  Add the contour of a text string flowing along a GraphicsPath to the current path.
- GraphicsPath AddTextUnderline (Point origin, string text, Font font, TextBaselines textBaseline=TextBaselines.Top)

  Add the contour of the underline of the specified text string to the current path.
- GraphicsPath AddSmoothSpline (params Point[ ] points)

  Adds a smooth spline composed of cubic bezier segments that pass through the specified points.
- GraphicsPath AddPath (GraphicsPath path)

  Adds another GraphicsPath to the current GraphicsPath.
- double MeasureLength ()

  Measures the length of the GraphicsPath.
- Point GetPointAtRelative (double position)

  Gets the point at the relative position specified on the GraphicsPath.
- Point GetPointAtAbsolute (double length)

  Gets the point at the absolute position specified on the GraphicsPath.
- Point GetTangentAtRelative (double position)

  Gets the tangent to the point at the relative position specified on the GraphicsPath.
- Point GetTangentAtAbsolute (double length)

  Gets the tangent to the point at the absolute position specified on the GraphicsPath.
- Point GetNormalAtAbsolute (double length)

  Gets the normal to the point at the absolute position specified on the GraphicsPath.
- Point GetNormalAtRelative (double position)

  Gets the normal to the point at the relative position specified on the GraphicsPath.
- GraphicsPath Linearise (double resolution)

  Linearises a GraphicsPath, replacing curve segments with series of line segments that approximate them.
- GraphicsPath Discretise (double resolution)

  Discretises a GraphicsPath, replacing curve segments with series of line segments that approximate them and ensuring that all line segments are shorter than the specified resolution .
- GraphicsPath Flatten (double flatness)

  Flattens a GraphicsPath, replacing curve segments with series of line segments that approximate them, ensuring the specified maximum deviation from the original path.
- IEnumerable< List< Point > > GetPoints ()

  Gets a collection of the end points of all the segments in the GraphicsPath, divided by figure.
- IEnumerable< GraphicsPath > GetFigures ()

Gets a collection of all the figures in the GraphicsPath, returned as individual GraphicsPaths.

- IEnumerable< List< Point > > GetLinearisationPointsNormals (double resolution)

  Gets a collection of the tangents at the end point of the segments in which the GraphicsPath would be linearised, divided by figure.
- IEnumerable< GraphicsPath > Triangulate (double resolution, bool clockwise)

  Divides a GraphicsPath into triangles.
- GraphicsPath Transform (Func< Point, Point > transformationFunction)

  Transforms all of the Points in the GraphicsPath with an arbitrary transformation function.
- Rectangle GetBounds ()

  Compute the rectangular bounds of the path.
- GraphicsPath Reverse ()

  Reverses the GraphicsPath.
- GraphicsPath GetStroke (double lineWidth=1, LineCaps lineCap=LineCaps.Butt, LineJoins lineJoin=LineJoins.Miter)

  Returns a GraphicsPath representing the stroke of the current GraphicsPath.
- bool ContainsPoint (Point point, FillRule fillRule)

  Determines whether the specified point falls within the current GraphicsPath.

Properties

- List< Segment > Segments = new List() `[get, set]`

  The segments that make up the path.

7.63.1 Detailed Description

Represents a graphics path that can be filled or stroked.

Definition at line 27 of file GraphicsPath.cs.

7.63.2 Member Function Documentation

7.63.2.1 AddPath()

```
GraphicsPath VectSharp.GraphicsPath.AddPath (
            GraphicsPath path )
```

Adds another GraphicsPath to the current GraphicsPath.

Parameters

path	The existing GraphicsPath that should be added to the current GraphicsPath.

Returns

The GraphicsPath, to allow for chained calls.

Definition at line 1209 of file GraphicsPath.cs.

7.63.2.2 AddSmoothSpline()

```
GraphicsPath VectSharp.GraphicsPath.AddSmoothSpline (
            params Point[] points )
```

Adds a smooth spline composed of cubic bezier segments that pass through the specified points.

Parameters

points	The points through which the spline should pass.

Returns

The GraphicsPath, to allow for chained calls.

Definition at line 1177 of file GraphicsPath.cs.

7.63.2.3 AddText() [1/2]

```
GraphicsPath VectSharp.GraphicsPath.AddText (
            double originX,
            double originY,
            string text,
            Font font,
            TextBaselines textBaseline = TextBaselines.Top )
```

Add the contour of a text string to the current path.

Parameters

originX	The horizontal coordinate of the text origin.
originY	The vertical coordinate of the text origin. See *textBaseline* .
text	The string to draw.
font	The font with which to draw the text.
textBaseline	The text baseline (determines what *originY* represents).

///

Returns

The GraphicsPath, to allow for chained calls.

Definition at line 357 of file GraphicsPath.cs.

7.63.2.4 AddText() [2/2]

```
GraphicsPath VectSharp.GraphicsPath.AddText (
            Point origin,
            string text,
            Font font,
            TextBaselines textBaseline = TextBaselines.Top )
```

Add the contour of a text string to the current path.

Parameters

origin	The text origin. See *textBaseline* .
text	The string to draw.
font	The font with which to draw the text.
textBaseline	The text baseline (determines what the vertical component of *origin* represents).

Returns

The GraphicsPath, to allow for chained calls.

Definition at line 370 of file GraphicsPath.cs.

7.63.2.5 AddTextOnPath()

```
GraphicsPath VectSharp.GraphicsPath.AddTextOnPath (
            GraphicsPath path,
            string text,
            Font font,
            double reference = 0,
            TextAnchors anchor = TextAnchors.Left,
            TextBaselines textBaseline = TextBaselines.Top )
```

Add the contour of a text string flowing along a GraphicsPath to the current path.

Parameters

path	The GraphicsPath along which the text will flow.
text	The string to draw.
font	The font with which to draw the text.
reference	The (relative) starting point on the path starting from which the text should be drawn (0 is the start of the path, 1 is the end of the path).
anchor	The anchor in the text string that will correspond to the point specified by the *reference* .
textBaseline	The text baseline (determines which the position of the text in relation to the *path* .

Returns

The GraphicsPath, to allow for chained calls.

Definition at line 475 of file GraphicsPath.cs.

7.63.2.6 AddTextUnderline()

```
GraphicsPath VectSharp.GraphicsPath.AddTextUnderline (
            Point origin,
            string text,
            Font font,
            TextBaselines textBaseline = TextBaselines.Top )
```

Add the contour of the underline of the specified text string to the current path.

Parameters

origin	The text origin. See *textBaseline* .
text	The string whose underline will be drawn.
font	The font with which to draw the text.
textBaseline	The text baseline (determines what the vertical component of *origin* represents).

Returns

The GraphicsPath, to allow for chained calls.

Definition at line 623 of file GraphicsPath.cs.

7.63.2.7 Arc() [1/2]

```
GraphicsPath VectSharp.GraphicsPath.Arc (
            double centerX,
            double centerY,
            double radius,
            double startAngle,
            double endAngle )
```

Trace an arc segment from a circle with the specified center and *radius* , starting at *startAngle* and ending at *endAngle* . The current point is updated to the end point of the arc.

Parameters

centerX	The horizontal coordinate of the center of the arc.
centerY	The vertical coordinate of the center of the arc.
radius	The radius of the arc.
startAngle	The start angle (in radians) of the arc.
endAngle	The end angle (in radians) of the arc.

Returns

The GraphicsPath, to allow for chained calls.

Definition at line 125 of file GraphicsPath.cs.

7.63.2.8 Arc() [2/2]

```
GraphicsPath VectSharp.GraphicsPath.Arc (
            Point center,
            double radius,
            double startAngle,
            double endAngle )
```

Trace an arc segment from a circle with the specified *center* and *radius* , starting at *startAngle* and ending at *endAngle* . The current point is updated to the end point of the arc.

Parameters

center	The center of the arc.
radius	The radius of the arc.
startAngle	The start angle (in radians) of the arc.
endAngle	The end angle (in radians) of the arc.

Returns

The GraphicsPath, to allow for chained calls.

Definition at line 102 of file GraphicsPath.cs.

7.63.2.9 Close()

```
GraphicsPath VectSharp.GraphicsPath.Close ( )
```

Trace a segment from the current point to the start point of the figure and flag the figure as closed.

Returns

The GraphicsPath, to allow for chained calls.

Definition at line 340 of file GraphicsPath.cs.

7.63.2.10 ContainsPoint()

```
bool VectSharp.GraphicsPath.ContainsPoint (
            Point point,
            FillRule fillRule )
```

Determines whether the specified *point* falls within the current GraphicsPath.

Parameters

point	The Point being analysed.
fillRule	The rule to use to determine whether a point is inside or outside of a the GraphicsPath.

Returns

`true` if the *point* is inside the GraphicsPath, or `false` if it is outside. If the point lies exactly on the GraphicsPath (or very close to it), the result may be either `true` or `false`, depending on numerical approximations.

Definition at line 3591 of file GraphicsPath.cs.

7.63.2.11 CubicBezierTo() [1/2]

```
GraphicsPath VectSharp.GraphicsPath.CubicBezierTo (
            double control1X,
            double control1Y,
            double control2X,
            double control2Y,
            double endPointX,
            double endPointY )
```

Trace a cubic Bezier curve from the current point to a destination point, with two control points. The current point is updated to the end point of the Bezier curve.

Parameters

control1X	The horizontal coordinate of the first control point.
control1Y	The vertical coordinate of the first control point.
control2X	The horizontal coordinate of the second control point.
control2Y	The vertical coordinate of the second control point.
endPointX	The horizontal coordinate of the destination point.
endPointY	The vertical coordinate of the destination point.

Returns

The GraphicsPath, to allow for chained calls.

Definition at line 284 of file GraphicsPath.cs.

7.63.2.12 CubicBezierTo() [2/2]

```
GraphicsPath VectSharp.GraphicsPath.CubicBezierTo (
            Point control1,
```

```
            Point control2,
            Point endPoint )
```

Trace a cubic Bezier curve from the current point to a destination point, with two control points. The current point is updated to the end point of the Bezier curve.

Parameters

control1	The first control point.
control2	The second control point.
endPoint	The destination point.

Returns

The GraphicsPath, to allow for chained calls.

Definition at line 260 of file GraphicsPath.cs.

7.63.2.13 Discretise()

```
GraphicsPath VectSharp.GraphicsPath.Discretise (
            double resolution )
```

Discretises a GraphicsPath, replacing curve segments with series of line segments that approximate them and ensuring that all line segments are shorter than the specified *resolution* .

Parameters

resolution	The maximum length (in absolute units) of line segments in the resulting GraphicsPath.

Returns

A GraphicsPath composed only of linear segments that are shorter than *resolution* and approximate the current GraphicsPath.

Definition at line 1963 of file GraphicsPath.cs.

7.63.2.14 EllipticalArc()

```
GraphicsPath VectSharp.GraphicsPath.EllipticalArc (
            double radiusX,
            double radiusY,
            double axisAngle,
            bool largeArc,
            bool sweepClockwise,
            Point endPoint )
```

Trace an arc from an ellipse with the specified radii, rotated by *axisAngle* with respect to the x-axis, starting at the current point and ending at the *endPoint* .

Parameters

radiusX	The horizontal radius of the ellipse.
radiusY	The vertical radius of the ellipse.
axisAngle	The angle of the horizontal axis of the ellipse with respect to the horizontal axis.
largeArc	Determines whether the large or the small arc is drawn.
sweepClockwise	Determines whether the clockwise or anticlockwise arc is drawn.
endPoint	The end point of the arc.

Returns

Definition at line 141 of file GraphicsPath.cs.

7.63.2.15 Flatten()

```
GraphicsPath VectSharp.GraphicsPath.Flatten (
            double flatness )
```

Flattens a GraphicsPath, replacing curve segments with series of line segments that approximate them, ensuring the specified maximum deviation from the original path.

Parameters

flatness	The maximum deviation from the original path.

Returns

A GraphicsPath composed only of linear segments that approximates the current GraphicsPath.

Definition at line 1993 of file GraphicsPath.cs.

7.63.2.16 GetBounds()

```
Rectangle VectSharp.GraphicsPath.GetBounds ( )
```

Compute the rectangular bounds of the path.

Returns

The smallest Rectangle that contains the path.

Definition at line 3031 of file GraphicsPath.cs.

7.63.2.17 GetFigures()

```
IEnumerable< GraphicsPath > VectSharp.GraphicsPath.GetFigures ( )
```

Gets a collection of all the figures in the GraphicsPath, returned as individual GraphicsPaths.

Returns

A collection of all the figures in the GraphicsPath, returned as individual GraphicsPaths.

Definition at line 2089 of file GraphicsPath.cs.

7.63.2.18 GetLinearisationPointsNormals()

```
IEnumerable< List< Point > > VectSharp.GraphicsPath.GetLinearisationPointsNormals (
            double resolution )
```

Gets a collection of the tangents at the end point of the segments in which the GraphicsPath would be linearised, divided by figure.

Parameters

resolution	The absolute length between successive samples in curve segments.

Returns

A collection of the tangents at the end point of the segments in which the GraphicsPath would be linearised, divided by figure.

Definition at line 2132 of file GraphicsPath.cs.

7.63.2.19 GetNormalAtAbsolute()

```
Point VectSharp.GraphicsPath.GetNormalAtAbsolute (
            double length )
```

Gets the normal to the point at the absolute position specified on the GraphicsPath.

Parameters

length	The distance to the point from the start of the GraphicsPath.

Returns

The normal to the point at the specified position.

Definition at line 1887 of file GraphicsPath.cs.

7.63.2.20 GetNormalAtRelative()

```
Point VectSharp.GraphicsPath.GetNormalAtRelative (
            double position )
```

Gets the normal to the point at the relative position specified on the GraphicsPath.

Parameters

position	The position on the GraphicsPath (0 is the start of the path, 1 is the end of the path).

Returns

The normal to the point at the specified position.

Definition at line 1898 of file GraphicsPath.cs.

7.63.2.21 GetPointAtAbsolute()

```
Point VectSharp.GraphicsPath.GetPointAtAbsolute (
            double length )
```

Gets the point at the absolute position specified on the GraphicsPath.

Parameters

length	The distance to the point from the start of the GraphicsPath.

Returns

The point at the specified position.

Definition at line 1303 of file GraphicsPath.cs.

7.63.2.22 GetPointAtRelative()

```
Point VectSharp.GraphicsPath.GetPointAtRelative (
            double position )
```

Gets the point at the relative position specified on the GraphicsPath.

Parameters

position	The position on the GraphicsPath (0 is the start of the path, 1 is the end of the path).

Returns

The point at the specified position.

Definition at line 1293 of file GraphicsPath.cs.

7.63.2.23 GetPoints()

```
IEnumerable< List< Point > > VectSharp.GraphicsPath.GetPoints ( )
```

Gets a collection of the end points of all the segments in the GraphicsPath, divided by figure.

Returns

A collection of the end points of all the segments in the GraphicsPath, divided by figure.

Definition at line 2046 of file GraphicsPath.cs.

7.63.2.24 GetStroke()

```
GraphicsPath VectSharp.GraphicsPath.GetStroke (
            double lineWidth = 1,
            LineCaps lineCap = LineCaps.Butt,
            LineJoins lineJoin = LineJoins.Miter )
```

Returns a GraphicsPath representing the stroke of the current GraphicsPath.

Parameters

lineWidth	The thickness of the stroke.
lineCap	The line cap used in the stroke.
lineJoin	The line join used in the stroke.

Returns

A GraphicsPath representing the stroke of the current GraphicsPath.

Definition at line 3437 of file GraphicsPath.cs.

7.63.2.25 GetTangentAtAbsolute()

```
Point VectSharp.GraphicsPath.GetTangentAtAbsolute (
            double length )
```

Gets the tangent to the point at the absolute position specified on the GraphicsPath.

Parameters

length	The distance to the point from the start of the GraphicsPath.

Returns

The tangent to the point at the specified position.

Definition at line 1600 of file GraphicsPath.cs.

7.63.2.26 GetTangentAtRelative()

```
Point VectSharp.GraphicsPath.GetTangentAtRelative (
            double position )
```

Gets the tangent to the point at the relative position specified on the GraphicsPath.

Parameters

position	The position on the GraphicsPath (0 is the start of the path, 1 is the end of the path).

Returns

The tangent to the point at the specified position.

Definition at line 1590 of file GraphicsPath.cs.

7.63.2.27 Linearise()

```
GraphicsPath VectSharp.GraphicsPath.Linearise (
            double resolution )
```

Linearises a GraphicsPath, replacing curve segments with series of line segments that approximate them.

Parameters

resolution	The absolute length between successive samples in curve segments.

Returns

A GraphicsPath composed only of linear segments that approximates the current GraphicsPath.

Definition at line 1909 of file GraphicsPath.cs.

7.63.2.28 LineTo() [1/2]

```
GraphicsPath VectSharp.GraphicsPath.LineTo (
            double x,
            double y )
```

Move the current point and trace a segment from the previous point.

Parameters

x	The horizontal coordinate of the new point.
y	The vertical coordinate of the new point.

Returns

The GraphicsPath, to allow for chained calls.

Definition at line 87 of file GraphicsPath.cs.

7.63.2.29 LineTo() [2/2]

```
GraphicsPath VectSharp.GraphicsPath.LineTo (
            Point p )
```

Move the current point and trace a segment from the previous point.

Parameters

p	The new point.

Returns

The GraphicsPath, to allow for chained calls.

Definition at line 65 of file GraphicsPath.cs.

7.63.2.30 MeasureLength()

```
double VectSharp.GraphicsPath.MeasureLength ( )
```

Measures the length of the GraphicsPath.

Returns

The length of the GraphicsPath

Definition at line 1221 of file GraphicsPath.cs.

7.63.2.31 MoveTo() [1/2]

```
GraphicsPath VectSharp.GraphicsPath.MoveTo (
            double x,
            double y )
```

Move the current point without tracing a segment from the previous point.

Parameters

x	The horizontal coordinate of the new point.
y	The vertical coordinate of the new point.

Returns

The GraphicsPath, to allow for chained calls.

Definition at line 54 of file GraphicsPath.cs.

7.63.2.32 MoveTo() [2/2]

```
GraphicsPath VectSharp.GraphicsPath.MoveTo (
            Point p )
```

Move the current point without tracing a segment from the previous point.

Parameters

p	The new point.

Returns

The GraphicsPath, to allow for chained calls.

Definition at line 40 of file GraphicsPath.cs.

7.63.2.33 QuadraticBezierTo() [1/2]

```
GraphicsPath VectSharp.GraphicsPath.QuadraticBezierTo (
            double controlX,
            double controlY,
            double endPointX,
            double endPointY )
```

Trace a quadratic Bezier curve from the current point to a destination point, with a single control point. The current point is updated to the end point of the Bezier curve.

Parameters

controlX	The horizontal coordinate of the control point.
controlY	The vertical coordinate of the control point.
endPointX	The horizontal coordinate of the destination point.
endPointY	The vertical coordinate of the destination point.

Returns

The GraphicsPath, to allow for chained calls.

Definition at line 330 of file GraphicsPath.cs.

7.63.2.34 QuadraticBezierTo() [2/2]

```
GraphicsPath VectSharp.GraphicsPath.QuadraticBezierTo (
            Point control,
            Point endPoint )
```

Trace a quadratic Bezier curve from the current point to a destination point, with a single control point. The current point is updated to the end point of the Bezier curve.

Parameters

control	The control point.
endPoint	The destination point.

Returns

The GraphicsPath, to allow for chained calls.

Definition at line 297 of file GraphicsPath.cs.

7.63.2.35 Reverse()

```
GraphicsPath VectSharp.GraphicsPath.Reverse ( )
```

Reverses the GraphicsPath.

Returns

The reversed GraphicsPath.

Definition at line 3328 of file GraphicsPath.cs.

7.63.2.36 Transform()

```
GraphicsPath VectSharp.GraphicsPath.Transform (
            Func< Point, Point > transformationFunction )
```

Transforms all of the Points in the GraphicsPath with an arbitrary transformation function.

Parameters

transformationFunction	An arbitrary transformation function.

Returns

A new GraphicsPath in which all points have been replaced using the *transformationFunction* .

Definition at line 3012 of file GraphicsPath.cs.

7.63.2.37 Triangulate()

```
IEnumerable< GraphicsPath > VectSharp.GraphicsPath.Triangulate (
            double resolution,
            bool clockwise )
```

Divides a GraphicsPath into triangles.

Parameters

resolution	The resolution that will be used to linearise curve segments in the GraphicsPath.
clockwise	If this is `true`, the triangles will have their vertices in a clockwise order, otherwise they will be in anticlockwise order.

Returns

A collection of distinct GraphicsPaths, each representing one triangle.

Definition at line 2225 of file GraphicsPath.cs.

7.63.3 Property Documentation

7.63.3.1 Segments

```
List<Segment> VectSharp.GraphicsPath.Segments = new List<Segment>()  [get], [set]
```

The segments that make up the path.

Definition at line 32 of file GraphicsPath.cs.

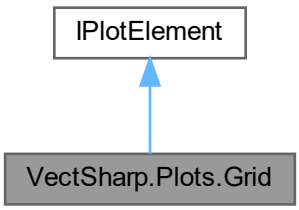
The documentation for this class was generated from the following file:

- VectSharp/GraphicsPath.cs

7.64 VectSharp.Plots.Grid Class Reference

A plot element that draws a grid.

Inheritance diagram for VectSharp.Plots.Grid:



Public Member Functions

- Grid (IReadOnlyList< double > side1Start, IReadOnlyList< double > side1End, IReadOnlyList< double > side2Start, IReadOnlyList< double > side2End, IContinuousCoordinateSystem coordinateSystem)

  Create a new Grid instance.
- void Plot (Graphics target)

  Draw the plot element on the specified target Graphics.

Parameters

target	*The Graphics on which to draw.*

Properties

- IReadOnlyList< double > Side1Start `[get, set]`

  The starting point for the first side of the grid.
- IReadOnlyList< double > Side1End `[get, set]`

  The ending point for the first side of the grid.
- IReadOnlyList< double > Side2Start `[get, set]`

  The starting point for the second side of the grid.
- IReadOnlyList< double > Side2End `[get, set]`

  The ending point for the second side of the grid.
- int IntervalCount = 10 `[get, set]`

  The number of intervals between grid lines. Note that the number of grid lines will be one greater than this.
- IContinuousCoordinateSystem CoordinateSystem `[get, set]`

  The coordinate system used to transform the points from data space to plot space.
- PlotElementPresentationAttributes PresentationAttributes = new PlotElementPresentationAttributes() { Stroke = new SolidColourBrush(Colour.FromRgb(220, 220, 220)) } `[get, set]`

  Presentation attributes determining the appearance of the grid.
- string Tag `[get, set]`

  A tag to identify the grid in the plot.

7.64.1 Detailed Description

A plot element that draws a grid.

Definition at line 827 of file Axes.cs.

7.64.2 Constructor & Destructor Documentation

7.64.2.1 Grid()

```
VectSharp.Plots.Grid.Grid (
            IReadOnlyList< double > side1Start,
            IReadOnlyList< double > side1End,
            IReadOnlyList< double > side2Start,
            IReadOnlyList< double > side2End,
            IContinuousCoordinateSystem coordinateSystem )
```

Create a new Grid instance.

Parameters

side1Start	The starting point for the first side of the grid.
side1End	The ending point for the first side of the grid.
side2Start	The starting point for the second side of the grid.
side2End	The ending point for the second side of the grid.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 878 of file Axes.cs.

7.64.3 Member Function Documentation

7.64.3.1 Plot()

```
void VectSharp.Plots.Grid.Plot (
            Graphics target )
```

Draw the plot element on the specified *target* Graphics.

Parameters

target	The Graphics on which to draw.

Implements VectSharp.Plots.IPlotElement.

Definition at line 888 of file Axes.cs.

7.64.4 Property Documentation

7.64.4.1 CoordinateSystem

```
IContinuousCoordinateSystem VectSharp.Plots.Grid.CoordinateSystem  [get], [set]
```

The coordinate system used to transform the points from data space to plot space.

Implements VectSharp.Plots.IPlotElement.

Definition at line 857 of file Axes.cs.

7.64.4.2 IntervalCount

```
int VectSharp.Plots.Grid.IntervalCount = 10  [get], [set]
```

The number of intervals between grid lines. Note that the number of grid lines will be one greater than this.

Definition at line 852 of file Axes.cs.

7.64.4.3 PresentationAttributes

```
PlotElementPresentationAttributes VectSharp.Plots.Grid.PresentationAttributes = new PlotElementPresentationAtt
{ Stroke = new SolidColourBrush(Colour.FromRgb(220, 220, 220)) }  [get], [set]
```

Presentation attributes determining the appearance of the grid.

Definition at line 863 of file Axes.cs.

7.64.4.4 Side1End

```
IReadOnlyList<double> VectSharp.Plots.Grid.Side1End  [get], [set]
```

The ending point for the first side of the grid.

Definition at line 837 of file Axes.cs.

7.64.4.5 Side1Start

```
IReadOnlyList<double> VectSharp.Plots.Grid.Side1Start  [get], [set]
```

The starting point for the first side of the grid.

Definition at line 832 of file Axes.cs.

7.64.4.6 Side2End

```
IReadOnlyList<double> VectSharp.Plots.Grid.Side2End  [get], [set]
```

The ending point for the second side of the grid.

Definition at line 847 of file Axes.cs.

7.64.4.7 Side2Start

```
IReadOnlyList<double> VectSharp.Plots.Grid.Side2Start  [get], [set]
```

The starting point for the second side of the grid.

Definition at line 842 of file Axes.cs.

7.64.4.8 Tag

```
string VectSharp.Plots.Grid.Tag  [get], [set]
```

A tag to identify the grid in the plot.

Definition at line 868 of file Axes.cs.

The documentation for this class was generated from the following file:

- VectSharp.Plots/Axes.cs

7.65 VectSharp.Markdown.HTTPUtils Class Reference

Contains utilities to resolve absolute and relative URIs.

Static Public Member Functions

- static string bool wasDownloaded ResolveImageURI (string uri, string baseUriString)

Static Public Attributes

- static string path

  Resolves an image Uri, by downloading the image file if necessary. It also takes care of ensuring that the file extension matches the format of the file.

Properties

- static bool LogDownloads = true `[get, set]`

  Determines whether every file that is downloaded should be logged to the standard error stream.

7.65.1 Detailed Description

Contains utilities to resolve absolute and relative URIs.

Definition at line 244 of file HtmlTag.cs.

7.65.2 Member Function Documentation

7.65.2.1 ResolveImageURI()

```
static string bool wasDownloaded VectSharp.Markdown.HTTPUtils.ResolveImageURI (
            string uri,
            string baseUriString )  [static]
```

Definition at line 257 of file HtmlTag.cs.

7.65.3 Member Data Documentation

7.65.3.1 path

```
string VectSharp.Markdown.HTTPUtils.path  [static]
```

Resolves an image Uri, by downloading the image file if necessary. It also takes care of ensuring that the file extension matches the format of the file.

Parameters

uri	The address of the image.
baseUriString	The base uri to use for relative uris.

Returns

A tuple containing the local path of the image file (either the original image, or a local copy of a remote file) and a boolean value indicating whether the image was fetched from a remote location and should be deleted after the program is done with it.

Definition at line 257 of file HtmlTag.cs.

7.65.4 Property Documentation

7.65.4.1 LogDownloads

```
bool VectSharp.Markdown.HTTPUtils.LogDownloads = true  [static], [get], [set]
```

Determines whether every file that is downloaded should be logged to the standard error stream.

Definition at line 249 of file HtmlTag.cs.

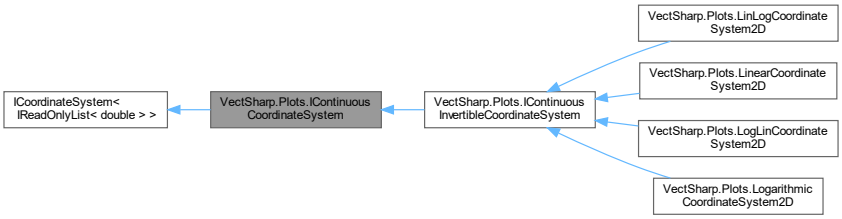
The documentation for this class was generated from the following file:

- VectSharp.Markdown/HtmlTag.cs

7.66 VectSharp.Plots.IContinuousCoordinateSystem Interface Reference

Represents a coordinate system performing continuous transformations.

Inheritance diagram for VectSharp.Plots.IContinuousCoordinateSystem:



Public Member Functions

- bool IsDirectionStraight (IReadOnlyList< double > direction)

  Determines whether points aligned along direction in data space are also aligned along some line in plot space.
- double[ ] GetAround (IReadOnlyList< double > point, IReadOnlyList< double > direction)

  Gets a data element that is arbitrarily close to the specified point , along the specified direction .

Properties

- bool IsLinear `[get]`

  Gets whether the current coordinate system is linear along all directions.
- double[ ] Resolution `[get]`

  The maximum difference between two points in data space that appear arbitrarily close in plot space, or some approximation.

7.66.1 Detailed Description

Represents a coordinate system performing continuous transformations.

Definition at line 89 of file CoordinateSystems.cs.

7.66.2 Member Function Documentation

7.66.2.1 GetAround()

```
double[] VectSharp.Plots.IContinuousCoordinateSystem.GetAround (
            IReadOnlyList< double > point,
            IReadOnlyList< double > direction )
```

Gets a data element that is arbitrarily close to the specified *point* , along the specified *direction* .

Parameters

point	The point close to which the returned data element should be.
direction	The direction (in data space) along which the returned point should be.

Returns

A data element that is arbitrarily close to the specified *point* , along the specified *direction* .

Implemented in VectSharp.Plots.LinearCoordinateSystem2D, VectSharp.Plots.LogarithmicCoordinateSystem2D, VectSharp.Plots.LogLinCoordinateSystem2D, and VectSharp.Plots.LinLogCoordinateSystem2D.

7.66.2.2 IsDirectionStraight()

```
bool VectSharp.Plots.IContinuousCoordinateSystem.IsDirectionStraight (
            IReadOnlyList< double > direction )
```

Determines whether points aligned along *direction* in data space are also aligned along some line in plot space.

Parameters

direction	The direction in data space along which the points should be aligned.

Returns

`true` if any two points aligned along *direction* in data space are also aligned along some line in plot space, `false` otherwise.

Implemented in VectSharp.Plots.LinearCoordinateSystem2D, VectSharp.Plots.LogarithmicCoordinateSystem2D, VectSharp.Plots.LogLinCoordinateSystem2D, and VectSharp.Plots.LinLogCoordinateSystem2D.

7.66.3 Property Documentation

7.66.3.1 IsLinear

```
bool VectSharp.Plots.IContinuousCoordinateSystem.IsLinear  [get]
```

Gets whether the current coordinate system is linear along all directions.

Implemented in VectSharp.Plots.LinearCoordinateSystem2D, VectSharp.Plots.LogarithmicCoordinateSystem2D, VectSharp.Plots.LogLinCoordinateSystem2D, and VectSharp.Plots.LinLogCoordinateSystem2D.

Definition at line 94 of file CoordinateSystems.cs.

7.66.3.2 Resolution

```
double [] VectSharp.Plots.IContinuousCoordinateSystem.Resolution  [get]
```

The maximum difference between two points in data space that appear arbitrarily close in plot space, or some approximation.

Implemented in VectSharp.Plots.LinearCoordinateSystem2D, VectSharp.Plots.LogarithmicCoordinateSystem2D, VectSharp.Plots.LogLinCoordinateSystem2D, and VectSharp.Plots.LinLogCoordinateSystem2D.

Definition at line 106 of file CoordinateSystems.cs.

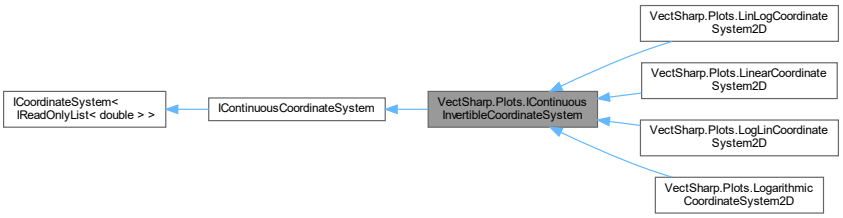
The documentation for this interface was generated from the following file:

- VectSharp.Plots/CoordinateSystems.cs

7.67 VectSharp.Plots.IContinuousInvertibleCoordinateSystem Interface Reference

Represents a coordinate system performing continuous invertible transformations.

Inheritance diagram for VectSharp.Plots.IContinuousInvertibleCoordinateSystem:



Public Member Functions

- double[] ToDataCoordinates (Point plotPoint)

  Transform a point in plot space back into data space.

Additional Inherited Members

7.67.1 Detailed Description

Represents a coordinate system performing continuous invertible transformations.

Definition at line 120 of file CoordinateSystems.cs.

7.67.2 Member Function Documentation

7.67.2.1 ToDataCoordinates()

```
double[] VectSharp.Plots.IContinuousInvertibleCoordinateSystem.ToDataCoordinates (
            Point plotPoint )
```

Transform a point in plot space back into data space.

Parameters

plotPoint	The point in plot space.

Returns

The point in data space corresponding to the specified point in plot space.

Implemented in VectSharp.Plots.LinearCoordinateSystem2D, VectSharp.Plots.LogarithmicCoordinateSystem2D, VectSharp.Plots.LogLinCoordinateSystem2D, and VectSharp.Plots.LinLogCoordinateSystem2D.

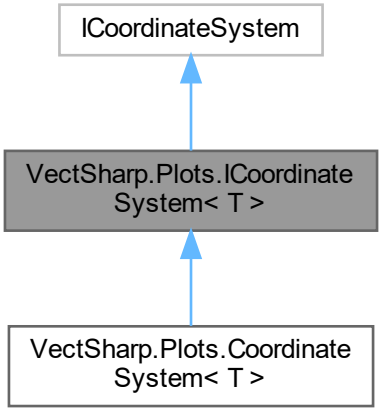
The documentation for this interface was generated from the following file:

- VectSharp.Plots/CoordinateSystems.cs

7.68 VectSharp.Plots.ICoordinateSystem< T > Interface Template Reference

Represents a coordinate system.

Inheritance diagram for VectSharp.Plots.ICoordinateSystem< T >:



Public Member Functions

- Point ToPlotCoordinates (T dataPoint)

  Transform the specified dataPoint into a plot Point.

7.68.1 Detailed Description

Represents a coordinate system.

Represents a coordinate system transforming data points of type *T* into plot Points.

Template Parameters

T	The type of data elements.

Definition at line 35 of file CoordinateSystems.cs.

7.68.2 Member Function Documentation

7.68.2.1 ToPlotCoordinates()

```
Point VectSharp.Plots.ICoordinateSystem< T >.ToPlotCoordinates (
            T dataPoint )
```

Transform the specified *dataPoint* into a plot Point.

Parameters

dataPoint	The data point whose coordinates should be determined.

Returns

A Point representing the *dataPoint* in plot space.

Implemented in VectSharp.Plots.CoordinateSystem< T >.

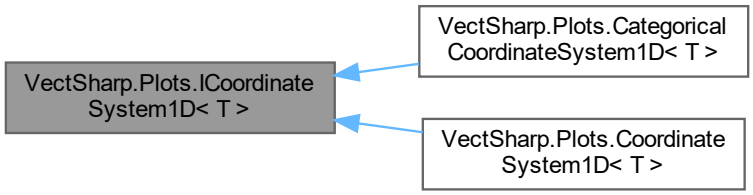
The documentation for this interface was generated from the following file:

- VectSharp.Plots/CoordinateSystems.cs

7.69 VectSharp.Plots.ICoordinateSystem1D< T > Interface Template Reference

Represents a coordinate system tranforming data points of type *T* into `double`s.

Inheritance diagram for VectSharp.Plots.ICoordinateSystem1D< T >:



Public Member Functions

- double ToPlotCoordinates (T dataPoint)

  Transform the specified dataPoint into a `double`.

7.69.1 Detailed Description

Represents a coordinate system tranforming data points of type *T* into `double`s.

Template Parameters

T	The type of data elements.

Definition at line 49 of file CoordinateSystems.cs.

7.69.2 Member Function Documentation

7.69.2.1 ToPlotCoordinates()

```
double VectSharp.Plots.ICoordinateSystem1D< T >.ToPlotCoordinates (
            T dataPoint )
```

Transform the specified *dataPoint* into a `double`.

Parameters

dataPoint	The data point whose coordinates should be determined.

Returns

A `double` representing the *dataPoint* in plot space.

Implemented in VectSharp.Plots.CoordinateSystem1D< T >, and VectSharp.Plots.CategoricalCoordinateSystem1D< T >.

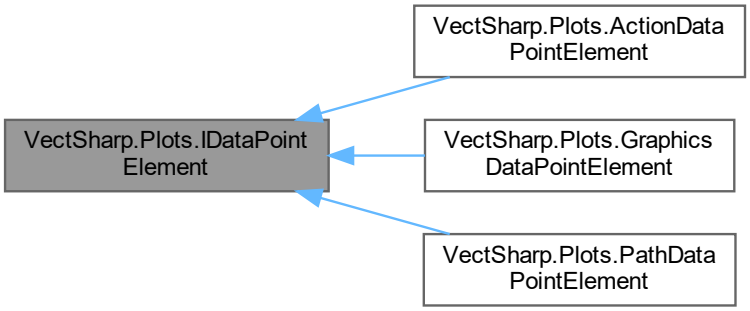
The documentation for this interface was generated from the following file:

- VectSharp.Plots/CoordinateSystems.cs

7.70 VectSharp.Plots.IDataPointElement Interface Reference

Represents a symbol that can be added to the plot at a specified position.

Inheritance diagram for VectSharp.Plots.IDataPointElement:



Public Member Functions

- void Plot (Graphics target, PlotElementPresentationAttributes presentationAttributes, string tag)

  Draw the symbol on the plot.

7.70.1 Detailed Description

Represents a symbol that can be added to the plot at a specified position.

Definition at line 26 of file DataPoints.cs.

7.70.2 Member Function Documentation

7.70.2.1 Plot()

```
void VectSharp.Plots.IDataPointElement.Plot (
            Graphics target,
            PlotElementPresentationAttributes presentationAttributes,
            string tag )
```

Draw the symbol on the plot.

Parameters

target	The Graphics object on which to draw. It is assumed that it has been transformed so that the symbol can be drawn centred at (0, 0)
presentationAttributes	Presentation attributes determining the appearance of the symbol.
tag	A tag to identify the symbol in the plot.

Implemented in VectSharp.Plots.PathDataPointElement, VectSharp.Plots.GraphicsDataPointElement, and VectSharp.Plots.ActionDataPointElement.

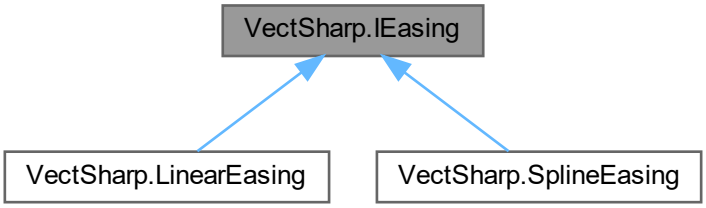
The documentation for this interface was generated from the following file:

- VectSharp.Plots/DataPoints.cs

7.71 VectSharp.IEasing Interface Reference

Describes a function used to transform the transition speed.

Inheritance diagram for VectSharp.IEasing:



Public Member Functions

- double Ease (double value)

  Applies the easing to the specified transition offset.

7.71.1 Detailed Description

Describes a function used to transform the transition speed.

Definition at line 1220 of file Animation.cs.

7.71.2 Member Function Documentation

7.71.2.1 Ease()

```
double VectSharp.IEasing.Ease (
            double value )
```

Applies the easing to the specified transition offset.

Parameters

value	The transition offset (ranging from 0 to 1).

Returns

The eased transition offset value.

Implemented in VectSharp.SplineEasing, and VectSharp.LinearEasing.

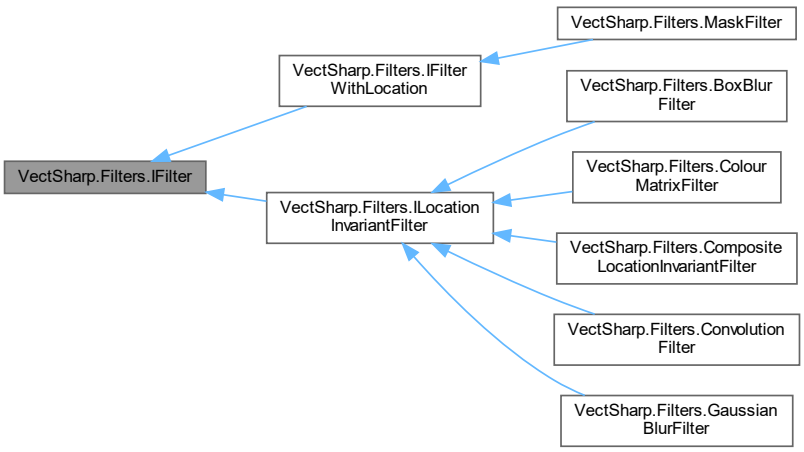
The documentation for this interface was generated from the following file:

- VectSharp/Animation.cs

7.72 VectSharp.Filters.IFilter Interface Reference

Represents a filter. Do not implement this interface directly; instead, implement ILocationInvariantFilter or IFilterWithLocation.

Inheritance diagram for VectSharp.Filters.IFilter:



Properties

- Point TopLeftMargin `[get]`

  Determines how much the area of the filter's subject should be expanded on the top-left to accommodate the results of the filter.

- Point BottomRightMargin `[get]`

  Determines how much the area of the filter's subject should be expanded on the bottom-right to accommodate the results of the filter.

7.72.1 Detailed Description

Represents a filter. Do not implement this interface directly; instead, implement ILocationInvariantFilter or IFilterWithLocation.

Definition at line 25 of file Filters.cs.

7.72.2 Property Documentation

7.72.2.1 BottomRightMargin

```
Point VectSharp.Filters.IFilter.BottomRightMargin [get]
```

Determines how much the area of the filter's subject should be expanded on the bottom-right to accommodate the results of the filter.

Implemented in VectSharp.Filters.BoxBlurFilter, VectSharp.Filters.ColourMatrixFilter, VectSharp.Filters.CompositeLocationInvariantFil VectSharp.Filters.ConvolutionFilter, VectSharp.Filters.GaussianBlurFilter, and VectSharp.Filters.MaskFilter.

Definition at line 35 of file Filters.cs.

7.72.2.2 TopLeftMargin

```
Point VectSharp.Filters.IFilter.TopLeftMargin [get]
```

Determines how much the area of the filter's subject should be expanded on the top-left to accommodate the results of the filter.

Implemented in VectSharp.Filters.BoxBlurFilter, VectSharp.Filters.ColourMatrixFilter, VectSharp.Filters.CompositeLocationInvariantFil VectSharp.Filters.ConvolutionFilter, VectSharp.Filters.GaussianBlurFilter, and VectSharp.Filters.MaskFilter.

Definition at line 30 of file Filters.cs.

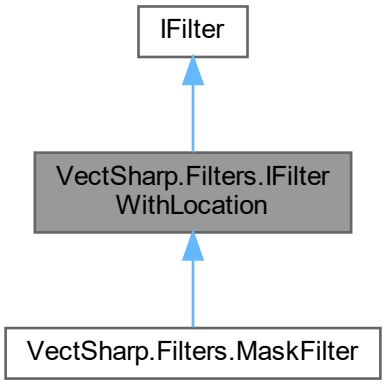
The documentation for this interface was generated from the following file:

- VectSharp/Filters/Filters.cs

7.73 VectSharp.Filters.IFilterWithLocation Interface Reference

Represents a filter whose results depend on the position of the subject image on the graphics surface.

Inheritance diagram for VectSharp.Filters.IFilterWithLocation:



Public Member Functions

- RasterImage Filter (RasterImage image, Rectangle bounds, double scale)
  Applies the filter to a RasterImage.

Additional Inherited Members

7.73.1 Detailed Description

Represents a filter whose results depend on the position of the subject image on the graphics surface.

Definition at line 55 of file Filters.cs.

7.73.2 Member Function Documentation

7.73.2.1 Filter()

```
RasterImage VectSharp.Filters.IFilterWithLocation.Filter (
            RasterImage image,
            Rectangle bounds,
            double scale )
```

Applies the filter to a RasterImage.

Parameters

image	The RasterImage to which the filter will be applied.
bounds	The region on the graphics surface where the image will be drawn.
scale	The scale of the image with respect to the filter.

Returns

A new RasterImage containing the filtered image. The source *image* is left unaltered.

Implemented in VectSharp.Filters.MaskFilter.

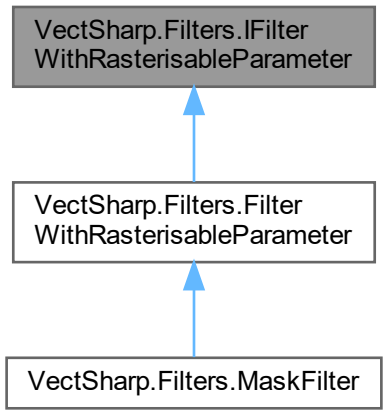
The documentation for this interface was generated from the following file:

- VectSharp/Filters/Filters.cs

7.74 VectSharp.Filters.IFilterWithRasterisableParameter Interface Reference

Represents a filter with a parameter that needs to be rasterised at the same resolution as the subject image prior to applying the filter. The FilterWithRasterisableParameter abstract class provides a default implementation of this interface.

Inheritance diagram for VectSharp.Filters.IFilterWithRasterisableParameter:



Public Member Functions

- void RasteriseParameter (Func< Graphics, Rectangle, double, bool, RasterImage > rasterisationMethod, double scale)

  Rasterises the filter's parameter at the specified scale, using the specified rasterisation method.

7.74.1 Detailed Description

Represents a filter with a parameter that needs to be rasterised at the same resolution as the subject image prior to applying the filter. The FilterWithRasterisableParameter abstract class provides a default implementation of this interface.

Definition at line 71 of file Filters.cs.

7.74.2 Member Function Documentation

7.74.2.1 RasteriseParameter()

```
void VectSharp.Filters.IFilterWithRasterisableParameter.RasteriseParameter (
            Func< Graphics, Rectangle, double, bool, RasterImage > rasterisationMethod,
            double scale )
```

Rasterises the filter's parameter at the specified scale, using the specified rasterisation method.

Parameters

rasterisationMethod	The method used to rasterise the image. The first argument of this method is the Graphics to be rasterised, the second is a Rectangle representing the region to rasterise, the third is a double representing the scale, and the third is a boolean value indicating whether the resulting RasterImage should be interpolated.
scale	The scale factor at which the parameter is rasterised.

Implemented in VectSharp.Filters.FilterWithRasterisableParameter.

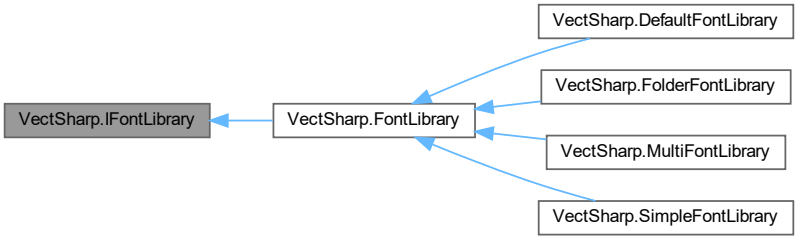
The documentation for this interface was generated from the following file:

- VectSharp/Filters/Filters.cs

7.75 VectSharp.IFontLibrary Interface Reference

Represents a font library with methods to create FontFamily objects from a string or from FontFamily.StandardFontFamilies.

Inheritance diagram for VectSharp.IFontLibrary:



Public Member Functions

- FontFamily ResolveFontFamily (string fontFamily)

  Create a new font family from the specified family name or true type file. If the family name or the true type file are not valid, an exception might be raised.
- FontFamily ResolveFontFamily (string fontFamily, params string[ ] fallback)

  Create a new font family from the specified family name or true type file. If the family name or the true type file are not valid, try to instantiate the font family using the fallback . If none of the fallback family names or true type files are valid, an exception might be raised.
- FontFamily ResolveFontFamily (FontFamily.StandardFontFamilies standardFontFamily)

  Create a new font family from the specified standard font family name.
- FontFamily ResolveFontFamily (string fontFamily, FontFamily.StandardFontFamilies finalFallback, params string[ ] fallback)

  Create a new font family from the specified family name or true type file. If the family name or the true type file are not valid, try to instantiate the font family using the fallback . If none of the fallback family names or true type files are valid, instantiate a standard font family using the finalFallback .

7.75.1 Detailed Description

Represents a font library with methods to create FontFamily objects from a string or from FontFamily.StandardFontFamilies.

Definition at line 28 of file FontLibrary.cs.

7.75.2 Member Function Documentation

7.75.2.1 ResolveFontFamily() [1/4]

```
FontFamily VectSharp.IFontLibrary.ResolveFontFamily (
            FontFamily.StandardFontFamilies standardFontFamily )
```

Create a new font family from the specified standard font family name.

Parameters

standardFontFamily	The standard name of the font family.

Returns

A FontFamily object corresponding to the specified font family.

Implemented in VectSharp.FontLibrary, VectSharp.SimpleFontLibrary, VectSharp.DefaultFontLibrary, VectSharp.FolderFontLibrary, and VectSharp.MultiFontLibrary.

7.75.2.2 ResolveFontFamily() [2/4]

```
FontFamily VectSharp.IFontLibrary.ResolveFontFamily (
            string fontFamily )
```

Create a new font family from the specified family name or true type file. If the family name or the true type file are not valid, an exception might be raised.

Parameters

fontFamily	The name of the font family to create, or the path to a TTF file.

Returns

If the font family name or the true type file is valid, a FontFamily object corresponding to the specified font family.

Implemented in VectSharp.FontLibrary, VectSharp.SimpleFontLibrary, VectSharp.DefaultFontLibrary, VectSharp.FolderFontLibrary, and VectSharp.MultiFontLibrary.

7.75.2.3 ResolveFontFamily() [3/4]

```
FontFamily VectSharp.IFontLibrary.ResolveFontFamily (
            string fontFamily,
            FontFamily.StandardFontFamilies finalFallback,
            params string[] fallback )
```

Create a new font family from the specified family name or true type file. If the family name or the true type file are not valid, try to instantiate the font family using the *fallback* . If none of the fallback family names or true type files are valid, instantiate a standard font family using the *finalFallback* .

Parameters

fontFamily	The name of the font family to create, or the path to a TTF file.
fallback	Names of additional font families or TTF files, which will be tried if the first *fontFamily* is not valid.
finalFallback	The standard name of the font family that will be used if none of the fallback families are valid.

Returns

A FontFamily object corresponding to the first of the specified font families that is valid.

Implemented in VectSharp.FontLibrary.

7.75.2.4 ResolveFontFamily() [4/4]

```
FontFamily VectSharp.IFontLibrary.ResolveFontFamily (
            string fontFamily,
            params string[] fallback )
```

Create a new font family from the specified family name or true type file. If the family name or the true type file are not valid, try to instantiate the font family using the *fallback* . If none of the fallback family names or true type files are valid, an exception might be raised.

Parameters

fontFamily	The name of the font family to create, or the path to a TTF file.
fallback	Names of additional font families or TTF files, which will be tried if the first *fontFamily* is not valid.

Returns

A FontFamily object corresponding to the first of the specified font families that is valid.

Implemented in VectSharp.FontLibrary.

The documentation for this interface was generated from the following file:

- VectSharp/FontLibrary.cs

7.76 VectSharp.IGraphicsContext Interface Reference

This interface should be implemented by classes intended to provide graphics output capability to a Graphics object.

Public Member Functions

- void **Save** ()

  Save the current transform state (rotation, translation, scale). This should be implemented as a LIFO stack.
- void **Restore** ()

  Restore the previous transform state (rotation, translation, scale). This should be implemented as a LIFO stack.
- void Translate (double x, double y)

  Translate the coordinate system origin.
- void Rotate (double angle)

  Rotate the coordinate system around the origin.
- void Scale (double scaleX, double scaleY)

  Scale the coordinate system with respect to the origin.
- void Transform (double a, double b, double c, double d, double e, double f)

  Transform the coordinate system with the specified transformation matrix [[a, c, e], [b, d, f], [0, 0, 1]].
- void FillText (string text, double x, double y)

  Fill a text string using the current Font and TextBaseline.
- void StrokeText (string text, double x, double y)

  Stroke the outline of a text string using the current Font and TextBaseline.
- void MoveTo (double x, double y)

  Change the current point without drawing a line from the previous point. If necessary, start a new figure.
- void LineTo (double x, double y)

  Draw a line from the previous point to the specified point.
- void **Close** ()

  Close the current figure.
- void **Stroke** ()

Stroke the current path using the current StrokeStyle, LineWidth, LineCap, LineJoin and LineDash.

- void **SetClippingPath** ()

  Set the current clipping path as the intersection of the previous clipping path and the current path.
- void SetFillStyle ((int r, int g, int b, double a) style)

  Set the current FillStyle.
- void SetFillStyle (Brush style)

  Set the current FillStyle.
- void SetStrokeStyle ((int r, int g, int b, double a) style)

  Set the current StrokeStyle.
- void SetStrokeStyle (Brush style)

  Set the current StrokeStyle.
- void CubicBezierTo (double p1X, double p1Y, double p2X, double p2Y, double p3X, double p3Y)

  Add to the current figure a cubic Bezier from the current point to a destination point, with two control points.
- void Rectangle (double x0, double y0, double width, double height)

  Add a rectangle figure to the current path.
- void Fill (FillRule fillRule)

  Fill the current path using the current FillStyle.
- void SetLineDash (LineDash dash)

  Set the current line dash pattern.
- void DrawRasterImage (int sourceX, int sourceY, int sourceWidth, int sourceHeight, double destinationX, double destinationY, double destinationWidth, double destinationHeight, RasterImage image)

  Draw a raster image.
- void DrawFilteredGraphics (Graphics graphics, IFilter filter)

  Draws a Graphics object, applying the specified filter .

Properties

- double Width `[get]`

  Width of the graphic surface.
- double Height `[get]`

  Height of the graphic surface.
- Font Font `[get, set]`

  The current font.
- TextBaselines TextBaseline `[get, set]`

  The current text baseline.
- Brush FillStyle `[get]`

  Current brush used to fill paths.
- Brush StrokeStyle `[get]`

  Current brush used to stroke paths.
- double LineWidth `[get, set]`

  Current line width used to stroke paths.
- LineCaps LineCap `[set]`

  Current line cap used to stroke paths.
- LineJoins LineJoin `[set]`

  Current line join used to stroke paths.
- string Tag `[get, set]`

  The current tag. How this can be used depends on each implementation.

7.76.1 Detailed Description

This interface should be implemented by classes intended to provide graphics output capability to a Graphics object.

Definition at line 35 of file Graphics.cs.

7.76.2 Member Function Documentation

7.76.2.1 CubicBezierTo()

```
void VectSharp.IGraphicsContext.CubicBezierTo (
            double p1X,
            double p1Y,
            double p2X,
            double p2Y,
            double p3X,
            double p3Y )
```

Add to the current figure a cubic Bezier from the current point to a destination point, with two control points.

Parameters

p1X	The horizontal coordinate of the first control point.
p1Y	The vertical coordinate of the first control point.
p2X	The horizontal coordinate of the second control point.
p2Y	The vertical coordinate of the second control point.
p3X	The horizontal coordinate of the destination point.
p3Y	The vertical coordinate of the destination point.

7.76.2.2 DrawFilteredGraphics()

```
void VectSharp.IGraphicsContext.DrawFilteredGraphics (
            Graphics graphics,
            IFilter filter )
```

Draws a Graphics object, applying the specified *filter* .

Parameters

graphics	The Graphics object to draw on the current Graphics object.
filter	An IFilter object, representing the filter to apply to the *graphics* object.

7.76.2.3 DrawRasterImage()

```
void VectSharp.IGraphicsContext.DrawRasterImage (
            int sourceX,
            int sourceY,
            int sourceWidth,
            int sourceHeight,
            double destinationX,
            double destinationY,
            double destinationWidth,
            double destinationHeight,
            RasterImage image )
```

Draw a raster image.

Parameters

sourceX	The horizontal coordinate of the top-left corner of the rectangle delimiting the source area of the image.
sourceY	The vertical coordinate of the top-left corner of the rectangle delimiting the source area of the image.
sourceWidth	The width of the rectangle delimiting the source area of the image.
sourceHeight	The height of the rectangle delimiting the source area of the image.
destinationX	The horizontal coordinate of the top-left corner of the rectangle delimiting the destination area of the image.
destinationY	The vertical coordinate of the top-left corner of the rectangle delimiting the destination area of the image.
destinationWidth	The width of the rectangle delimiting the destination area of the image.
destinationHeight	The height of the rectangle delimiting the destination area of the image.
image	The image to draw.

7.76.2.4 Fill()

```
void VectSharp.IGraphicsContext.Fill (
            FillRule fillRule )
```

Fill the current path using the current FillStyle.

Parameters

fillRule	The FillRule that determines which parts of the path are filled.

7.76.2.5 FillText()

```
void VectSharp.IGraphicsContext.FillText (
            string text,
```

```
            double x,
            double y )
```

Fill a text string using the current Font and TextBaseline.

Parameters

text	The string to draw.
x	The horizontal coordinate of the text origin.
y	The vertical coordinate of the text origin.

7.76.2.6 LineTo()

```
void VectSharp.IGraphicsContext.LineTo (
            double x,
            double y )
```

Draw a line from the previous point to the specified point.

Parameters

x	The horizontal coordinate of the point.
y	The vertical coordinate of the point.

7.76.2.7 MoveTo()

```
void VectSharp.IGraphicsContext.MoveTo (
            double x,
            double y )
```

Change the current point without drawing a line from the previous point. If necessary, start a new figure.

Parameters

x	The horizontal coordinate of the point.
y	The vertical coordinate of the point.

7.76.2.8 Rectangle()

```
void VectSharp.IGraphicsContext.Rectangle (
            double x0,
```

```
            double y0,
            double width,
            double height )
```

Add a rectangle figure to the current path.

Parameters

x0	The horizontal coordinate of the top-left corner of the rectangle.
y0	The vertical coordinate of the top-left corner of the rectangle.
width	The width of corner of the rectangle.
height	The height of corner of the rectangle.

7.76.2.9 Rotate()

```
void VectSharp.IGraphicsContext.Rotate (
            double angle )
```

Rotate the coordinate system around the origin.

Parameters

angle	The angle (in radians) by which to rotate the coordinate system.

7.76.2.10 Scale()

```
void VectSharp.IGraphicsContext.Scale (
            double scaleX,
            double scaleY )
```

Scale the coordinate system with respect to the origin.

Parameters

scaleX	The horizontal scale.
scaleY	The vertical scale.

7.76.2.11 SetFillStyle() [1/2]

```
void VectSharp.IGraphicsContext.SetFillStyle (
            (int r, int g, int b, double a) style )
```

Set the current FillStyle.

Parameters

style	A ValueTuple<Int32, Int32, Int32, Double> containing component information for the colour. For r, g, and b, range: [0, 255]; for a, range: [0, 1].

7.76.2.12 SetFillStyle() [2/2]

```
void VectSharp.IGraphicsContext.SetFillStyle (
            Brush style )
```

Set the current FillStyle.

Parameters

style	The new fill style.

7.76.2.13 SetLineDash()

```
void VectSharp.IGraphicsContext.SetLineDash (
            LineDash dash )
```

Set the current line dash pattern.

Parameters

dash	The line dash pattern.

7.76.2.14 SetStrokeStyle() [1/2]

```
void VectSharp.IGraphicsContext.SetStrokeStyle (
            (int r, int g, int b, double a) style )
```

Set the current StrokeStyle.

Parameters

style	A ValueTuple<Int32, Int32, Int32, Double> containing component information for the colour. For r, g, and b, range: [0, 255]; for a, range: [0, 1].

7.76.2.15 SetStrokeStyle() [2/2]

```
void VectSharp.IGraphicsContext.SetStrokeStyle (
            Brush style )
```

Set the current StrokeStyle.

Parameters

style	The new stroke style.

7.76.2.16 StrokeText()

```
void VectSharp.IGraphicsContext.StrokeText (
            string text,
            double x,
            double y )
```

Stroke the outline of a text string using the current Font and TextBaseline.

Parameters

text	The string to draw.
x	The horizontal coordinate of the text origin.
y	The vertical coordinate of the text origin.

7.76.2.17 Transform()

```
void VectSharp.IGraphicsContext.Transform (
            double a,
            double b,
            double c,
            double d,
            double e,
            double f )
```

Transform the coordinate system with the specified transformation matrix [[a, c, e], [b, d, f], [0, 0, 1]].

Parameters

a	The first element of the first column.
b	The second element of the first column.
c	The first element of the second column.
d	The second element of the second column.
e	The first element of the third column.
f	The second element of the third column.

7.76.2.18 Translate()

```
void VectSharp.IGraphicsContext.Translate (
            double x,
            double y )
```

Translate the coordinate system origin.

Parameters

x	The horizontal translation.
y	The vertical translation.

7.76.3 Property Documentation

7.76.3.1 FillStyle

```
Brush VectSharp.IGraphicsContext.FillStyle  [get]
```

Current brush used to fill paths.

Definition at line 146 of file Graphics.cs.

7.76.3.2 Font

```
Font VectSharp.IGraphicsContext.Font  [get], [set]
```

The current font.

Definition at line 91 of file Graphics.cs.

7.76.3.3 Height

```
double VectSharp.IGraphicsContext.Height  [get]
```

Height of the graphic surface.

Definition at line 45 of file Graphics.cs.

7.76.3.4 LineCap

```
LineCaps VectSharp.IGraphicsContext.LineCap  [set]
```

Current line cap used to stroke paths.

Definition at line 211 of file Graphics.cs.

7.76.3.5 LineJoin

```
LineJoins VectSharp.IGraphicsContext.LineJoin  [set]
```

Current line join used to stroke paths.

Definition at line 216 of file Graphics.cs.

7.76.3.6 LineWidth

```
double VectSharp.IGraphicsContext.LineWidth  [get], [set]
```

Current line width used to stroke paths.

Definition at line 206 of file Graphics.cs.

7.76.3.7 StrokeStyle

```
Brush VectSharp.IGraphicsContext.StrokeStyle  [get]
```

Current brush used to stroke paths.

Definition at line 163 of file Graphics.cs.

7.76.3.8 Tag

```
string VectSharp.IGraphicsContext.Tag  [get], [set]
```

The current tag. How this can be used depends on each implementation.

Definition at line 227 of file Graphics.cs.

7.76.3.9 TextBaseline

```
TextBaselines VectSharp.IGraphicsContext.TextBaseline  [get], [set]
```

The current text baseline.

Definition at line 96 of file Graphics.cs.

7.76.3.10 Width

```
double VectSharp.IGraphicsContext.Width  [get]
```

Width of the graphic surface.

Definition at line 40 of file Graphics.cs.

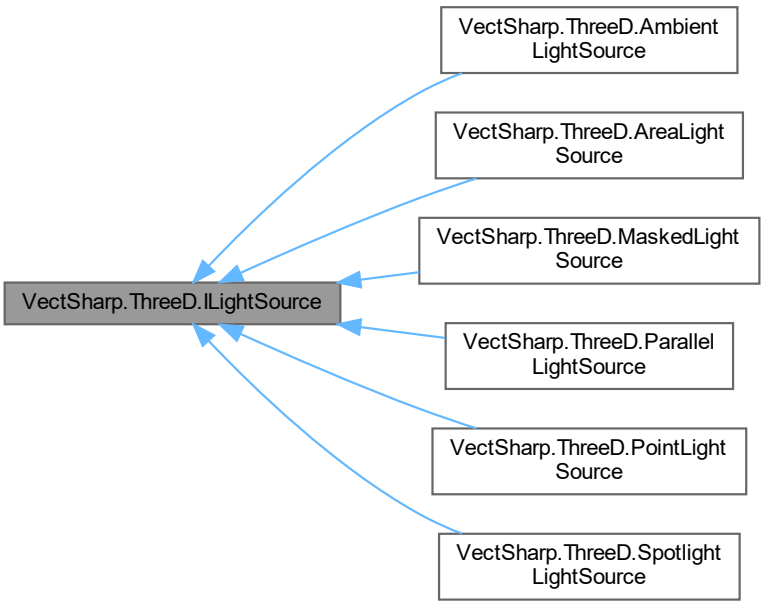
The documentation for this interface was generated from the following file:

- VectSharp/Graphics.cs

7.77 VectSharp.ThreeD.ILightSource Interface Reference

Represents a light source.

Inheritance diagram for VectSharp.ThreeD.ILightSource:



Public Member Functions

- LightIntensity GetLightAt (Point3D point)

  Computes the light intensity at the specified point, without taking into account any obstructions.
- double GetObstruction (Point3D point, IEnumerable< Triangle3DElement > shadowingTriangles)

  Determines the amount of obstruction of the light that results at point due to the specified shadowingTriangles .

Properties

- bool CastsShadow `[get]`

  Determines whether the light casts a shadow or not.

7.77.1 Detailed Description

Represents a light source.

Definition at line 65 of file Lights.cs.

7.77.2 Member Function Documentation

7.77.2.1 GetLightAt()

```
LightIntensity VectSharp.ThreeD.ILightSource.GetLightAt (
            Point3D point )
```

Computes the light intensity at the specified point, without taking into account any obstructions.

Parameters

point	The Point3DElement at which the light intensity should be computed.

Returns

Implemented in VectSharp.ThreeD.AmbientLightSource, VectSharp.ThreeD.ParallelLightSource, VectSharp.ThreeD.PointLightSource, VectSharp.ThreeD.SpotlightLightSource, VectSharp.ThreeD.MaskedLightSource, and VectSharp.ThreeD.AreaLightSource.

7.77.2.2 GetObstruction()

```
double VectSharp.ThreeD.ILightSource.GetObstruction (
            Point3D point,
            IEnumerable< Triangle3DElement > shadowingTriangles )
```

Determines the amount of obstruction of the light that results at *point* due to the specified *shadowingTriangles* .

Parameters

point	The Point3D at which the obstruction should be computed.
shadowingTriangles	A collection of Triangle3DElement casting shadows.

Returns

1 if the light is completely obstructed, 0 if the light is completely visible, a value between these if the light is partially obstructed.

Implemented in VectSharp.ThreeD.AmbientLightSource, VectSharp.ThreeD.ParallelLightSource, VectSharp.ThreeD.PointLightSource, VectSharp.ThreeD.SpotlightLightSource, VectSharp.ThreeD.MaskedLightSource, and VectSharp.ThreeD.AreaLightSource.

7.77.3 Property Documentation

7.77.3.1 CastsShadow

```
bool VectSharp.ThreeD.ILightSource.CastsShadow  [get]
```

Determines whether the light casts a shadow or not.

Implemented in VectSharp.ThreeD.AmbientLightSource, VectSharp.ThreeD.ParallelLightSource, VectSharp.ThreeD.PointLightSource, VectSharp.ThreeD.SpotlightLightSource, VectSharp.ThreeD.MaskedLightSource, and VectSharp.ThreeD.AreaLightSource.

Definition at line 77 of file Lights.cs.

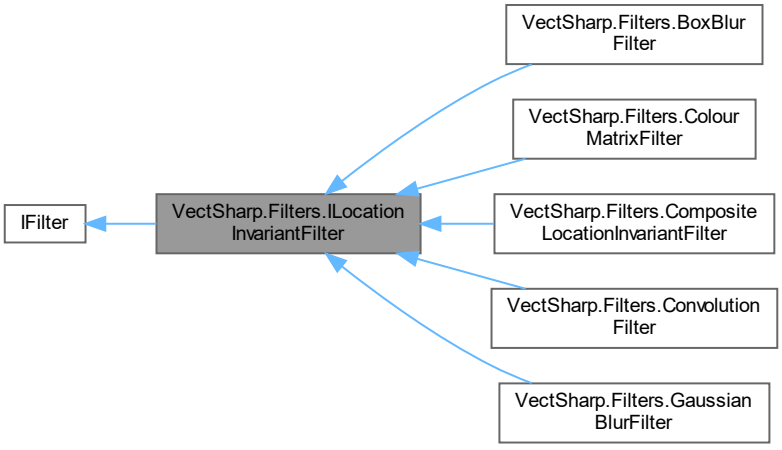
The documentation for this interface was generated from the following file:

- VectSharp.ThreeD/Lights.cs

7.78 VectSharp.Filters.ILocationInvariantFilter Interface Reference

Represents a filter that can be applied to an image regardless of its location on the graphics surface.

Inheritance diagram for VectSharp.Filters.ILocationInvariantFilter:



Public Member Functions

- RasterImage Filter (RasterImage image, double scale)

  Applies the filter to a RasterImage.

Additional Inherited Members

7.78.1 Detailed Description

Represents a filter that can be applied to an image regardless of its location on the graphics surface.

Definition at line 41 of file Filters.cs.

7.78.2 Member Function Documentation

7.78.2.1 Filter()

```
RasterImage VectSharp.Filters.ILocationInvariantFilter.Filter (
            RasterImage image,
            double scale )
```

Applies the filter to a RasterImage.

Parameters

image	The RasterImage to which the filter will be applied.
scale	The scale of the image with respect to the filter.

Returns

A new RasterImage containing the filtered image. The source *image* is left unaltered.

Implemented in VectSharp.Filters.BoxBlurFilter, VectSharp.Filters.ColourMatrixFilter, VectSharp.Filters.CompositeLocationInvariantFil
VectSharp.Filters.ConvolutionFilter, and VectSharp.Filters.GaussianBlurFilter.

The documentation for this interface was generated from the following file:

- VectSharp/Filters/Filters.cs

7.79 VectSharp.Raster.ImageSharp.ImageSharpContextInterpreter Class Reference

Contains methods to render a Page to an Image.

Classes

- class UnknownFormatException

  The exception that is raised when the output file format is not specified and the file name does not have an extension corresponding to a known file format.

Static Public Member Functions

- static Image< SixLabors.ImageSharp.PixelFormats.Rgba32 > SaveAsImage (this Page page, double scale=1)

  Render the page to an Image object.
- static void SaveAsImage (this Page page, Stream imageStream, OutputFormats outputFormat, double scale=1)

  Render the page to an image stream.
- static void SaveAsImage (this Page page, string fileName, OutputFormats? outputFormat=null, double scale=1)

  Render the page to an image file.
- static DisposableIntPtr SaveAsRawBytes (this Page pag, out int width, out int height, out int totalSize, double scale=1)

  Render the page to raw pixel data, in 32bpp RGBA format.
- static byte[ ] SaveAsRawBytes (this Page pag, out int width, out int height, double scale=1)

  Return the page to raw pixel data, in 32bpp RGBA format.
- static RasterImage Rasterise (this Graphics graphics, Rectangle region, double scale, bool interpolate)

  Rasterise a region of a Graphics object.
- static Image SaveAsAnimatedGIF (this Animation animation, double scale=1, double frameRate=50, double durationScaling=1, GifColorTableMode colorTableMode=GifColorTableMode.Local)

  Saves the animation to an animated GIF.
- static void SaveAsAnimatedGIF (this Animation animation, Stream imageStream, double scale=1, double frameRate=50, double durationScaling=1, GifColorTableMode colorTableMode=GifColorTableMode.Local)

  Saves the animation to an animated GIF stream.
- static void SaveAsAnimatedGIF (this Animation animation, string fileName, double scale=1, double frameRate=50, double durationScaling=1, GifColorTableMode colorTableMode=GifColorTableMode.Local)

  Saves the animation to an animated GIF file.
- static void SaveAsAnimatedPNG (this Animation animation, Stream imageStream, double scale=1, double frameRate=60, double durationScaling=1, AnimatedPNG.InterframeCompression interframeCompression=AnimatedPNG.InterframeCompression.First)

  Saves the animation to a stream in animated PNG format.
- static void SaveAsAnimatedPNG (this Animation animation, string fileName, double scale=1, double frameRate=60, double durationScaling=1, AnimatedPNG.InterframeCompression interframeCompression=AnimatedPNG.InterframeCompression.First)

  Saves the animation to an animated PNG file.

7.79.1 Detailed Description

Contains methods to render a Page to an Image.

Definition at line 1051 of file ImageSharpContext.cs.

7.79.2 Member Function Documentation

7.79.2.1 Rasterise()

```
static RasterImage VectSharp.Raster.ImageSharp.ImageSharpContextInterpreter.Rasterise (
            this Graphics graphics,
            Rectangle region,
            double scale,
            bool interpolate )  [static]
```

Rasterise a region of a Graphics object.

Parameters

graphics	The Graphics object that will be rasterised.
region	The region of the *graphics* that will be rasterised.
scale	The scale at which the image will be rendered.
interpolate	Whether the resulting image should be interpolated or not when it is drawn on another Graphics surface.

Returns

A RasterImage containing the rasterised graphics.

Definition at line 1283 of file ImageSharpContext.cs.

7.79.2.2 SaveAsAnimatedGIF() [1/3]

```
static Image VectSharp.Raster.ImageSharp.ImageSharpContextInterpreter.SaveAsAnimatedGIF (
            this Animation animation,
            double scale = 1,
            double frameRate = 50,
            double durationScaling = 1,
            GifColorTableMode colorTableMode = GifColorTableMode.Local )  [static]
```

Saves the animation to an animated GIF.

Parameters

animation	The animation to export.
scale	The scale at which the animation will be rendered.
frameRate	The target frame rate of the animation, in frames-per-second (fps). This is capped by the animated GIF specification at 50 fps.
durationScaling	A scaling factor that will be applied to all durations in the animation. Values greater than 1 slow down the animation, values smaller than 1 accelerate it. Note that this does not affect the frame rate of the animation.
colorTableMode	Determines whether a single colour table should be used for the whole image, or if a different colour table should be used for each frame.

Returns

An Image containing the animated GIF.

Definition at line 1331 of file ImageSharpContext.cs.

7.79.2.3 SaveAsAnimatedGIF() [2/3]

```
static void VectSharp.Raster.ImageSharp.ImageSharpContextInterpreter.SaveAsAnimatedGIF (
            this Animation animation,
            Stream imageStream,
            double scale = 1,
            double frameRate = 50,
            double durationScaling = 1,
            GifColorTableMode colorTableMode = GifColorTableMode.Local )  [static]
```

Saves the animation to an animated GIF stream.

Parameters

animation	The animation to export.
imageStream	The stream on which the animated GIF will be written.
scale	The scale at which the animation will be rendered.
frameRate	The target frame rate of the animation, in frames-per-second (fps). This is capped by the animated GIF specification at 50 fps.
durationScaling	A scaling factor that will be applied to all durations in the animation. Values greater than 1 slow down the animation, values smaller than 1 accelerate it. Note that this does not affect the frame rate of the animation.
colorTableMode	Determines whether a single colour table should be used for the whole image, or if a different colour table should be used for each frame.

Definition at line 1390 of file ImageSharpContext.cs.

7.79.2.4 SaveAsAnimatedGIF() [3/3]

```
static void VectSharp.Raster.ImageSharp.ImageSharpContextInterpreter.SaveAsAnimatedGIF (
            this Animation animation,
            string fileName,
            double scale = 1,
            double frameRate = 50,
            double durationScaling = 1,
            GifColorTableMode colorTableMode = GifColorTableMode.Local )  [static]
```

Saves the animation to an animated GIF file.

Parameters

animation	The animation to export.
fileName	The output file to create.

Parameters

scale	The scale at which the animation will be rendered.
frameRate	The target frame rate of the animation, in frames-per-second (fps). This is capped by the animated GIF specification at 50 fps.
durationScaling	A scaling factor that will be applied to all durations in the animation. Values greater than 1 slow down the animation, values smaller than 1 accelerate it. Note that this does not affect the frame rate of the animation.
colorTableMode	Determines whether a single colour table should be used for the whole image, or if a different colour table should be used for each frame.

Definition at line 1406 of file ImageSharpContext.cs.

7.79.2.5 SaveAsAnimatedPNG() [1/2]

```
static void VectSharp.Raster.ImageSharp.ImageSharpContextInterpreter.SaveAsAnimatedPNG (
            this Animation animation,
            Stream imageStream,
            double scale = 1,
            double frameRate = 60,
            double durationScaling = 1,
            AnimatedPNG.InterframeCompression interframeCompression = AnimatedPNG.InterframeCompression.First
)  [static]
```

Saves the animation to a stream in animated PNG format.

Parameters

animation	The animation to export.
imageStream	The stream on which the animated PNG will be written.
scale	The scale at which the animation will be rendered.
frameRate	The target frame rate of the animation, in frames-per-second (fps). This is capped by the animated PNG specification at 90 fps.
durationScaling	A scaling factor that will be applied to all durations in the animation. Values greater than 1 slow down the animation, values smaller than 1 accelerate it. Note that this does not affect the frame rate of the animation.
interframeCompression	The kind of compression that will be used to reduce file size. Note that if the animation has a transparent background, no compression can be performed, and the value of this parameter is ignored.

Definition at line 1423 of file ImageSharpContext.cs.

7.79.2.6 SaveAsAnimatedPNG() [2/2]

```
static void VectSharp.Raster.ImageSharp.ImageSharpContextInterpreter.SaveAsAnimatedPNG (
            this Animation animation,
            string fileName,
```

```
            double scale = 1,
            double frameRate = 60,
            double durationScaling = 1,
            AnimatedPNG.InterframeCompression interframeCompression = AnimatedPNG.InterframeCompression.First
)  [static]
```

Saves the animation to an animated PNG file.

Parameters

animation	The animation to export.
fileName	The output file to create.
scale	The scale at which the animation will be rendered.
frameRate	The target frame rate of the animation, in frames-per-second (fps). This is capped by the animated PNG specification at 90 fps.
durationScaling	A scaling factor that will be applied to all durations in the animation. Values greater than 1 slow down the animation, values smaller than 1 accelerate it. Note that this does not affect the frame rate of the animation.
interframeCompression	The kind of compression that will be used to reduce file size. Note that if the animation has a transparent background, no compression can be performed, and the value of this parameter is ignored.

Definition at line 1511 of file ImageSharpContext.cs.

7.79.2.7 SaveAsImage() [1/3]

```
static Image< SixLabors.ImageSharp.PixelFormats.Rgba32 > VectSharp.Raster.ImageSharp.Image↩
SharpContextInterpreter.SaveAsImage (
            this Page page,
            double scale = 1 )  [static]
```

Render the page to an Image object.

Parameters

page	The Page to render.
scale	The scale to be used when rasterising the page. This will determine the width and height of the Image.

Returns

An Image containing the rasterised page.

Definition at line 1059 of file ImageSharpContext.cs.

7.79.2.8 SaveAsImage() [2/3]

```
static void VectSharp.Raster.ImageSharp.ImageSharpContextInterpreter.SaveAsImage (
            this Page page,
```

```
            Stream imageStream,
            OutputFormats outputFormat,
            double scale = 1 )  [static]
```

Render the page to an image stream.

Parameters

page	The Page to render.
imageStream	The Stream on which the image data will be written.
outputFormat	The format of the image that will be created.
scale	The scale to be used when rasterising the page. This will determine the width and height of the image.

Definition at line 1075 of file ImageSharpContext.cs.

7.79.2.9 SaveAsImage() [3/3]

```
static void VectSharp.Raster.ImageSharp.ImageSharpContextInterpreter.SaveAsImage (
            this Page page,
            string fileName,
            OutputFormats?  outputFormat = null,
            double scale = 1 )  [static]
```

Render the page to an image file.

Parameters

page	The Page to render.
fileName	The path of the file where the image will be saved.
outputFormat	The format of the image that will be created. If this is `null` (the default), the format is desumed from the extension of the file.
scale	The scale to be used when rasterising the page. This will determine the width and height of the image.

Definition at line 1133 of file ImageSharpContext.cs.

7.79.2.10 SaveAsRawBytes() [1/2]

```
static byte[] VectSharp.Raster.ImageSharp.ImageSharpContextInterpreter.SaveAsRawBytes (
            this Page pag,
            out int width,
            out int height,
            double scale = 1 )  [static]
```

Return the page to raw pixel data, in 32bpp RGBA format.

Parameters

pag	The Page to render.
scale	The scale to be used when rasterising the page. This will determine the width and height of the image.
width	The width of the rendered image.
height	The height of the rendered image.

Returns

A byte array containing the raw pixel data.

Definition at line 1246 of file ImageSharpContext.cs.

7.79.2.11 SaveAsRawBytes() [2/2]

```
static DisposableIntPtr VectSharp.Raster.ImageSharp.ImageSharpContextInterpreter.SaveAsRaw↩
Bytes (
            this Page pag,
            out int width,
            out int height,
            out int totalSize,
            double scale = 1 )  [static]
```

Render the page to raw pixel data, in 32bpp RGBA format.

Parameters

pag	The Page to render.
scale	The scale to be used when rasterising the page. This will determine the width and height of the image.
width	The width of the rendered image.
height	The height of the rendered image.
totalSize	The size in bytes of the raw pixel data.

Returns

A DisposableIntPtr containing a pointer to the raw pixel data, stored in unmanaged memory. Dispose this object to release the unmanaged memory.

The documentation for this class was generated from the following file:

- VectSharp.Raster.ImageSharp/ImageSharpContext.cs

7.80 VectSharp.ImageSharpUtils.ImageURIParser Class Reference

Provides a method to parse an image URI into a page.

Static Public Member Functions

- static Func< string, bool, Page > Parser (Func< string, bool, Page > parseSVG)

  Parses an image URI into a page. This is intended to replace the default image URI interpreter in `VectSharp.SVG.Parser.ParseImageURI`. To do this, use something like:

7.80.1 Detailed Description

Provides a method to parse an image URI into a page.

Definition at line 29 of file ImageUriParser.cs.

7.80.2 Member Function Documentation

7.80.2.1 Parser()

```
static Func< string, bool, Page > VectSharp.ImageSharpUtils.ImageURIParser.Parser (
            Func< string, bool, Page > parseSVG )  [static]
```

Parses an image URI into a page. This is intended to replace the default image URI interpreter in `VectSharp.SVG.Parser.ParseImageURI`. To do this, use something like:

```
VectSharp.SVG.Parser.ParseImageURI = VectSharp.ImageSharpUtils.ImageURIParser.Parser(Vec
```

Parameters

parseSVG	A function to parse an SVG image uri into a page. You should pass `VectSharp.SVG.Parser.ParseSVGURI` as this argument.

Returns

A function to parse an image URI into a page.

Definition at line 37 of file ImageUriParser.cs.

The documentation for this class was generated from the following file:

- VectSharp.ImageSharpUtils/ImageUriParser.cs

7.81 VectSharp.MuPDFUtils.ImageURIParser Class Reference

Provides a method to parse an image URI into a page.

Static Public Member Functions

- static Func< string, bool, Page > Parser (Func< string, bool, Page > parseSVG)

  Parses an image URI into a page. This is intended to replace the default image URI interpreter in `VectSharp.SVG.Parser.ParseImageURI`. To do this, use something like:

7.81.1 Detailed Description

Provides a method to parse an image URI into a page.

Definition at line 29 of file ImageURIParser.cs.

7.81.2 Member Function Documentation

7.81.2.1 Parser()

```
static Func< string, bool, Page > VectSharp.MuPDFUtils.ImageURIParser.Parser (
            Func< string, bool, Page > parseSVG )  [static]
```

Parses an image URI into a page. This is intended to replace the default image URI interpreter in `VectSharp.SVG.Parser.ParseImageURI`. To do this, use something like:

```
VectSharp.SVG.Parser.ParseImageURI = VectSharp.MuPDFUtils.ImageURIParser.Parser(VectShar
```

Parameters

parseSVG	A function to parse an SVG image uri into a page. You should pass `VectSharp.SVG.Parser.ParseSVGURI` as this argument.

Returns

A function to parse an image URI into a page.

Definition at line 37 of file ImageURIParser.cs.

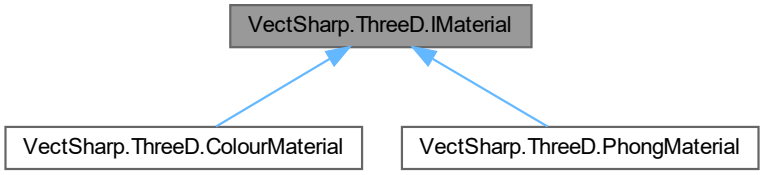
The documentation for this class was generated from the following file:

- VectSharp.MuPDFUtils/ImageURIParser.cs

7.82 VectSharp.ThreeD.IMaterial Interface Reference

Represents a material used to the determine the appearance of Triangle3DElement.

Inheritance diagram for VectSharp.ThreeD.IMaterial:



Public Member Functions

- Colour GetColour (Point3D point, NormalizedVector3D surfaceNormal, Camera camera, IList< ILightSource > lights, IList< double > obstructions)

  Obtains the Colour at the specified point.

7.82.1 Detailed Description

Represents a material used to the determine the appearance of Triangle3DElement.

Definition at line 31 of file Materials.cs.

7.82.2 Member Function Documentation

7.82.2.1 GetColour()

```
Colour VectSharp.ThreeD.IMaterial.GetColour (
            Point3D point,
            NormalizedVector3D surfaceNormal,
            Camera camera,
            IList< ILightSource > lights,
            IList< double > obstructions )
```

Obtains the Colour at the specified point.

Parameters

point	The point whose colour should be determined.
surfaceNormal	The normal to the surface at the specified *point* .
camera	The camera being used to render the scene.
lights	A list of light sources that are present in the scene.
obstructions	A list of values indicating how obstructed each light source is.

Returns

The Colour of the specified point.

Implemented in VectSharp.ThreeD.ColourMaterial, and VectSharp.ThreeD.PhongMaterial.

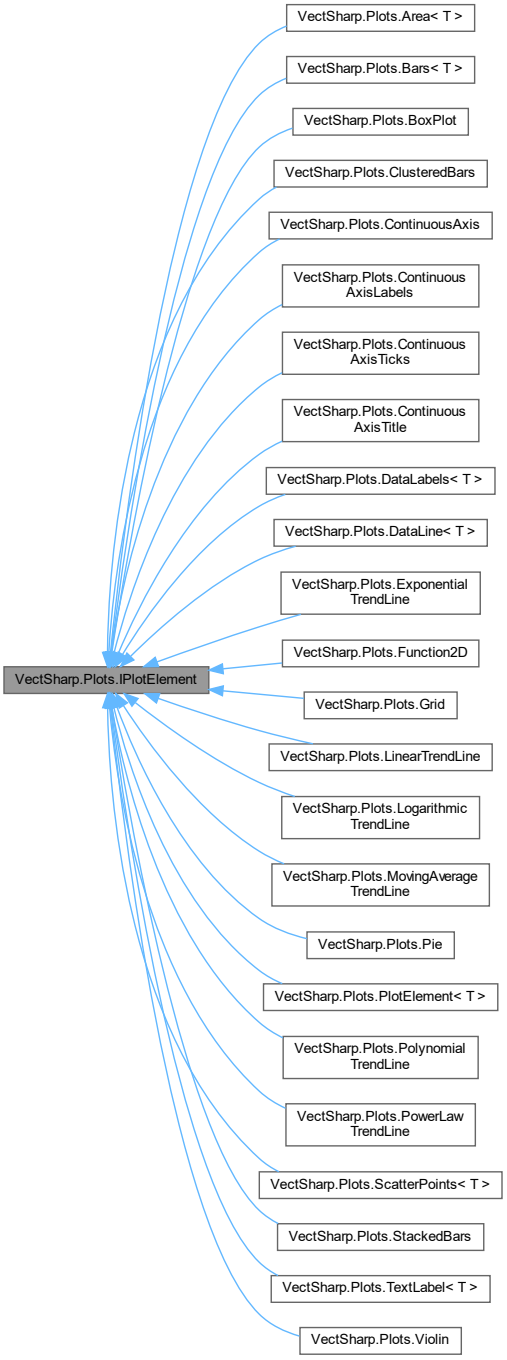
The documentation for this interface was generated from the following file:

- VectSharp.ThreeD/Materials.cs

7.83 VectSharp.Plots.IPlotElement Interface Reference

Represents a plot element.

Inheritance diagram for VectSharp.Plots.IPlotElement:



Public Member Functions

- void Plot (Graphics target)

  Draw the plot element on the specified target Graphics.

Properties

- ICoordinateSystem CoordinateSystem [get]

  The coordinate system used to transform the points from data space to plot space.

7.83.1 Detailed Description

Represents a plot element.

Definition at line 91 of file Plot.cs.

7.83.2 Member Function Documentation

7.83.2.1 Plot()

```
void VectSharp.Plots.IPlotElement.Plot (
            Graphics target )
```

Draw the plot element on the specified *target* Graphics.

Parameters

target	The Graphics on which to draw.

Implemented in VectSharp.Plots.ContinuousAxis, VectSharp.Plots.ContinuousAxisTicks, VectSharp.Plots.ContinuousAxisLabels, VectSharp.Plots.ContinuousAxisTitle, VectSharp.Plots.Grid, VectSharp.Plots.Bars< T >, VectSharp.Plots.StackedBars, VectSharp.Plots.ClusteredBars, VectSharp.Plots.BoxPlot, VectSharp.Plots.ScatterPoints< T >, VectSharp.Plots.TextLabel< T >, VectSharp.Plots.DataLabels< T >, VectSharp.Plots.DataLine< T >, VectSharp.Plots.Area< T >, VectSharp.Plots.Function2D, VectSharp.Plots.Pie, VectSharp.Plots.PlotElement< T >, VectSharp.Plots.LinearTrendLine, VectSharp.Plots.ExponentialTrendLine, VectSharp.Plots.LogarithmicTrendLine, VectSharp.Plots.PolynomialTrendLine, VectSharp.Plots.PowerLawTrendLine, VectSharp.Plots.MovingAverageTrendLine, and VectSharp.Plots.Violin.

7.83.3 Property Documentation

7.83.3.1 CoordinateSystem

```
ICoordinateSystem VectSharp.Plots.IPlotElement.CoordinateSystem [get]
```

The coordinate system used to transform the points from data space to plot space.

Implemented in VectSharp.Plots.ContinuousAxis, VectSharp.Plots.ContinuousAxisTicks, VectSharp.Plots.ContinuousAxisLabels, VectSharp.Plots.ContinuousAxisTitle, VectSharp.Plots.Grid, VectSharp.Plots.Bars< T >, VectSharp.Plots.StackedBars, VectSharp.Plots.ClusteredBars, VectSharp.Plots.BoxPlot, VectSharp.Plots.ScatterPoints< T >, VectSharp.Plots.TextLabel< T >,

VectSharp.Plots.DataLabels< T >, VectSharp.Plots.DataLine< T >, VectSharp.Plots.Area< T >, VectSharp.Plots.Function2D, VectSharp.Plots.Pie, VectSharp.Plots.PlotElement< T >, VectSharp.Plots.LinearTrendLine, VectSharp.Plots.ExponentialTrendLine, VectSharp.Plots.LogarithmicTrendLine, VectSharp.Plots.PolynomialTrendLine, VectSharp.Plots.PowerLawTrendLine, VectSharp.Plots.MovingAverageTrendLine, and VectSharp.Plots.Violin.

Definition at line 102 of file Plot.cs.

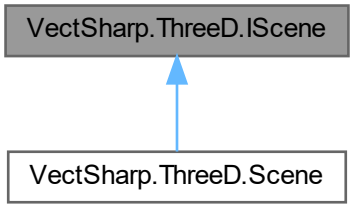
The documentation for this interface was generated from the following file:

- VectSharp.Plots/Plot.cs

7.84 VectSharp.ThreeD.IScene Interface Reference

Represents a 3D scene.

Inheritance diagram for VectSharp.ThreeD.IScene:



Public Member Functions

- void AddElement (Element3D element)

  Adds the specified element to the scene.
- void AddRange (IEnumerable< Element3D > elements)

  Adds the specified elements to the scene.
- void Replace (Func< Element3D, Element3D > replacementFunction)

  Replaces each element in the scene with the element returned by the replacementFunction .
- void Replace (Func< Element3D, IEnumerable< Element3D > > replacementFunction)

  Replaces each element in the scene with the element(s) returned by the replacementFunction .

Properties

- IEnumerable< Element3D > SceneElements `[get]`

  The Element3Ds constituting the scene.
- object SceneLock `[get]`

  An object used to synchronise multithreaded rendering of the same scene.

7.84.1 Detailed Description

Represents a 3D scene.

Definition at line 26 of file Scene.cs.

7.84.2 Member Function Documentation

7.84.2.1 AddElement()

```
void VectSharp.ThreeD.IScene.AddElement (
            Element3D element )
```

Adds the specified *element* to the scene.

Parameters

element	The Element3D to add.

Implemented in VectSharp.ThreeD.Scene.

7.84.2.2 AddRange()

```
void VectSharp.ThreeD.IScene.AddRange (
            IEnumerable< Element3D > elements )
```

Adds the specified *elements* to the scene.

Parameters

elements	A collection of Element3Ds to add.

Implemented in VectSharp.ThreeD.Scene.

7.84.2.3 Replace() [1/2]

```
void VectSharp.ThreeD.IScene.Replace (
            Func< Element3D, Element3D > replacementFunction )
```

Replaces each element in the scene with the element returned by the *replacementFunction* .

Parameters

replacementFunction	A function replacing each Element3D in the scene with another Element3D.

Implemented in VectSharp.ThreeD.Scene.

7.84.2.4 Replace() [2/2]

```
void VectSharp.ThreeD.IScene.Replace (
            Func< Element3D, IEnumerable< Element3D > > replacementFunction )
```

Replaces each element in the scene with the element(s) returned by the *replacementFunction* .

Parameters

replacementFunction	A function replacing each Element3D in the scene with 0 or more Element3Ds.

Implemented in VectSharp.ThreeD.Scene.

7.84.3 Property Documentation

7.84.3.1 SceneElements

```
IEnumerable<Element3D> VectSharp.ThreeD.IScene.SceneElements  [get]
```

The Element3Ds constituting the scene.

Implemented in VectSharp.ThreeD.Scene.

Definition at line 31 of file Scene.cs.

7.84.3.2 SceneLock

```
object VectSharp.ThreeD.IScene.SceneLock  [get]
```

An object used to synchronise multithreaded rendering of the same scene.

Implemented in VectSharp.ThreeD.Scene.

Definition at line 60 of file Scene.cs.

The documentation for this interface was generated from the following file:

- VectSharp.ThreeD/Scene.cs

7.85 VectSharp.ThreeD.LightIntensity Struct Reference

Represents the intensity of a light source at a particular point.

Public Member Functions

- LightIntensity (double intensity, NormalizedVector3D direction)

  Creates a new LightIntensity.
- void Deconstruct (out double intensity, out NormalizedVector3D direction)

  Deconstructs the struct.

Public Attributes

- double Intensity

  The intensity of the light.
- NormalizedVector3D Direction

  The direction towards from which the light comes.

7.85.1 Detailed Description

Represents the intensity of a light source at a particular point.

Definition at line 27 of file Lights.cs.

7.85.2 Constructor & Destructor Documentation

7.85.2.1 LightIntensity()

```
VectSharp.ThreeD.LightIntensity.LightIntensity (
            double intensity,
            NormalizedVector3D direction )
```

Creates a new LightIntensity.

Parameters

intensity	The intensity of the light.
direction	The direction from which the light comes.

Definition at line 44 of file Lights.cs.

7.85.3 Member Function Documentation

7.85.3.1 Deconstruct()

```
void VectSharp.ThreeD.LightIntensity.Deconstruct (
            out double intensity,
            out NormalizedVector3D direction )
```

Deconstructs the struct.

Parameters

intensity	This parameter will hold the Intensity of the light.
direction	This parameter will hold the Direction of the light.

Definition at line 55 of file Lights.cs.

7.85.4 Member Data Documentation

7.85.4.1 Direction

```
NormalizedVector3D VectSharp.ThreeD.LightIntensity.Direction
```

The direction towards from which the light comes.

Definition at line 37 of file Lights.cs.

7.85.4.2 Intensity

```
double VectSharp.ThreeD.LightIntensity.Intensity
```

The intensity of the light.

Definition at line 32 of file Lights.cs.

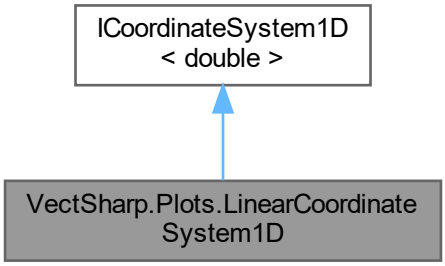
The documentation for this struct was generated from the following file:

- VectSharp.ThreeD/Lights.cs

7.86 VectSharp.Plots.LinearCoordinateSystem1D Class Reference

Represents a 1-D linear coordinate system.

Inheritance diagram for VectSharp.Plots.LinearCoordinateSystem1D:



Public Member Functions

- LinearCoordinateSystem1D (double min, double max, double scale)

  Creates a new LinearCoordinateSystem1D, manually specifying the parameters.
- LinearCoordinateSystem1D (IReadOnlyList< double > data, double scale=350)

  Creates a new LinearCoordinateSystem1D determining the value range from the data .
- double ToPlotCoordinates (double dataPoint)

Properties

- double Min `[get, set]`

  The minimum value.
- double Max `[get, set]`

  The maximum value.
- double Scale `[get, set]`

  The scale factor.

7.86.1 Detailed Description

Represents a 1-D linear coordinate system.

Definition at line 923 of file CoordinateSystems.cs.

7.86.2 Constructor & Destructor Documentation

7.86.2.1 LinearCoordinateSystem1D() [1/2]

```
VectSharp.Plots.LinearCoordinateSystem1D.LinearCoordinateSystem1D (
            double min,
            double max,
            double scale )
```

Creates a new LinearCoordinateSystem1D, manually specifying the parameters.

Parameters

min	The minimum value.
max	The maximum value.
scale	The scale factor.

Definition at line 946 of file CoordinateSystems.cs.

7.86.2.2 LinearCoordinateSystem1D() [2/2]

```
VectSharp.Plots.LinearCoordinateSystem1D.LinearCoordinateSystem1D (
            IReadOnlyList< double > data,
            double scale = 350 )
```

Creates a new LinearCoordinateSystem1D determining the value range from the *data* .

Parameters

data	The data from which the value range should be determined.
scale	The scale factor.

Definition at line 958 of file CoordinateSystems.cs.

7.86.3 Member Function Documentation

7.86.3.1 ToPlotCoordinates()

```
double VectSharp.Plots.LinearCoordinateSystem1D.ToPlotCoordinates (
            double dataPoint )
```

Definition at line 978 of file CoordinateSystems.cs.

7.86.4 Property Documentation

7.86.4.1 Max

```
double VectSharp.Plots.LinearCoordinateSystem1D.Max  [get], [set]
```

The maximum value.

Definition at line 933 of file CoordinateSystems.cs.

7.86.4.2 Min

```
double VectSharp.Plots.LinearCoordinateSystem1D.Min  [get], [set]
```

The minimum value.

Definition at line 928 of file CoordinateSystems.cs.

7.86.4.3 Scale

```
double VectSharp.Plots.LinearCoordinateSystem1D.Scale  [get], [set]
```

The scale factor.

Definition at line 938 of file CoordinateSystems.cs.

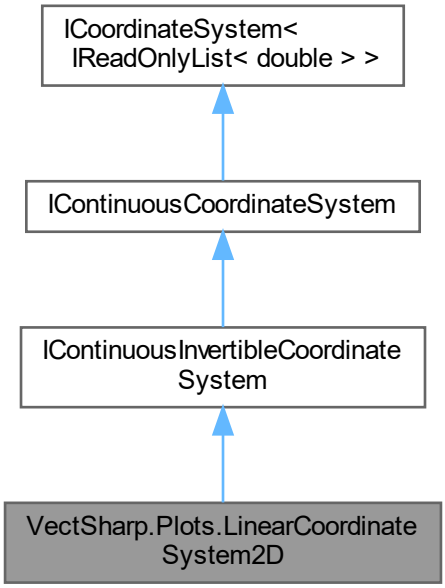
The documentation for this class was generated from the following file:

- VectSharp.Plots/CoordinateSystems.cs

7.87 VectSharp.Plots.LinearCoordinateSystem2D Class Reference

Represents a linear coordinate system.

Inheritance diagram for VectSharp.Plots.LinearCoordinateSystem2D:



Public Member Functions

- bool IsDirectionStraight (IReadOnlyList< double > direction)

  Determines whether points aligned along direction in data space are also aligned along some line in plot space.

Parameters

direction	*The direction in data space along which the points should be aligned.*

Returns

`true` *if any two points aligned along direction in data space are also aligned along some line in plot space,* `false` *otherwise.*

- LinearCoordinateSystem2D (double minX, double maxX, double minY, double maxY, double scaleX, double scaleY)

  Creates a new LinearCoordinateSystem2D manually specifying the parameter values.

- LinearCoordinateSystem2D (IReadOnlyList< IReadOnlyList< double > > data, double scaleX=350, double scaleY=250)

  Creates a new LinearCoordinateSystem2D determining the value range from the data .

- LinearCoordinateSystem2D (double[,] data, double scaleX=350, double scaleY=250)

  Creates a new LinearCoordinateSystem2D determining the value range from the data .

- double[ ] ToDataCoordinates (Point plotPoint)

  Transform a point in plot space back into data space.

Parameters

plotPoint	*The point in plot space.*

Returns

The point in data space corresponding to the specified point in plot space.

- Point ToPlotCoordinates (IReadOnlyList< double > dataPoint)
- Point ToPlotCoordinates (Point dataPoint)

  Transforms the specified dataPoint into a plot point.
- double[ ] GetAround (IReadOnlyList< double > point, IReadOnlyList< double > direction)

  Gets a data element that is arbitrarily close to the specified point , along the specified direction .

Parameters

point	*The point close to which the returned data element should be.*
direction	*The direction (in data space) along which the returned point should be.*

Returns

A data element that is arbitrarily close to the specified point , along the specified direction .

Properties

- double MinX `[get, set]`

  The minimum X value.
- double MaxX `[get, set]`

  The maximum X value.
- double MinY `[get, set]`

  The minimum Y value.
- double MaxY `[get, set]`

  The maximum Y value.
- double ScaleX `[get, set]`

  The X scale.
- double ScaleY `[get, set]`

  The y scale.
- bool IsLinear `[get]`

  Gets whether the current coordinate system is linear along all directions.
- double[ ] Resolution `[get, set]`

  The maximum difference between two points in data space that appear arbitrarily close in plot space, or some approximation.

7.87.1 Detailed Description

Represents a linear coordinate system.

Definition at line 133 of file CoordinateSystems.cs.

7.87.2 Constructor & Destructor Documentation

7.87.2.1 LinearCoordinateSystem2D() [1/3]

```
VectSharp.Plots.LinearCoordinateSystem2D.LinearCoordinateSystem2D (
            double minX,
            double maxX,
            double minY,
            double maxY,
            double scaleX,
            double scaleY )
```

Creates a new LinearCoordinateSystem2D manually specifying the parameter values.

Parameters

minX	The minimum X value.
maxX	The maximum X value.
minY	The minimum Y value.
maxY	The maximum Y value.
scaleX	The X scale.
scaleY	The Y scale.

Definition at line 196 of file CoordinateSystems.cs.

7.87.2.2 LinearCoordinateSystem2D() [2/3]

```
VectSharp.Plots.LinearCoordinateSystem2D.LinearCoordinateSystem2D (
            IReadOnlyList< IReadOnlyList< double > > data,
            double scaleX = 350,
            double scaleY = 250 )
```

Creates a new LinearCoordinateSystem2D determining the value range from the *data* .

Parameters

data	The data from which the value range should be determined.
scaleX	The X scale.
scaleY	The Y scale.

Definition at line 212 of file CoordinateSystems.cs.

7.87.2.3 LinearCoordinateSystem2D() [3/3]

```
VectSharp.Plots.LinearCoordinateSystem2D.LinearCoordinateSystem2D (
            double data[,],
            double scaleX = 350,
            double scaleY = 250 )
```

Creates a new LinearCoordinateSystem2D determining the value range from the *data* .

Parameters

data	The data from which the value range should be determined.
scaleX	The X scale.
scaleY	The Y scale.

Definition at line 248 of file CoordinateSystems.cs.

7.87.3 Member Function Documentation

7.87.3.1 GetAround()

```
double[] VectSharp.Plots.LinearCoordinateSystem2D.GetAround (
            IReadOnlyList< double > point,
            IReadOnlyList< double > direction )
```

Gets a data element that is arbitrarily close to the specified *point* , along the specified *direction* .

Parameters

point	The point close to which the returned data element should be.
direction	The direction (in data space) along which the returned point should be.

Returns

A data element that is arbitrarily close to the specified *point* , along the specified *direction* .

Implements VectSharp.Plots.IContinuousCoordinateSystem.

Definition at line 301 of file CoordinateSystems.cs.

7.87.3.2 IsDirectionStraight()

```
bool VectSharp.Plots.LinearCoordinateSystem2D.IsDirectionStraight (
            IReadOnlyList< double > direction )
```

Determines whether points aligned along *direction* in data space are also aligned along some line in plot space.

Parameters

direction	The direction in data space along which the points should be aligned.

Returns

`true` if any two points aligned along *direction* in data space are also aligned along some line in plot space, `false` otherwise.

Implements VectSharp.Plots.IContinuousCoordinateSystem.

7.87.3.3 ToDataCoordinates()

```
double[] VectSharp.Plots.LinearCoordinateSystem2D.ToDataCoordinates (
            Point plotPoint )
```

Transform a point in plot space back into data space.

Parameters

plotPoint	The point in plot space.

Returns

The point in data space corresponding to the specified point in plot space.

Implements VectSharp.Plots.IContinuousInvertibleCoordinateSystem.

Definition at line 279 of file CoordinateSystems.cs.

7.87.3.4 ToPlotCoordinates() [1/2]

```
Point VectSharp.Plots.LinearCoordinateSystem2D.ToPlotCoordinates (
            IReadOnlyList< double > dataPoint )
```

Definition at line 285 of file CoordinateSystems.cs.

7.87.3.5 ToPlotCoordinates() [2/2]

```
Point VectSharp.Plots.LinearCoordinateSystem2D.ToPlotCoordinates (
            Point dataPoint )
```

Transforms the specified *dataPoint* into a plot point.

Parameters

dataPoint	The data whose plot coordinates should be determined.

Returns

A Point representing the *dataPoint* in plot space.

Definition at line 295 of file CoordinateSystems.cs.

7.87.4 Property Documentation

7.87.4.1 IsLinear

```
bool VectSharp.Plots.LinearCoordinateSystem2D.IsLinear  [get]
```

Gets whether the current coordinate system is linear along all directions.

Implements VectSharp.Plots.IContinuousCoordinateSystem.

Definition at line 166 of file CoordinateSystems.cs.

7.87.4.2 MaxX

```
double VectSharp.Plots.LinearCoordinateSystem2D.MaxX  [get], [set]
```

The maximum X value.

Definition at line 143 of file CoordinateSystems.cs.

7.87.4.3 MaxY

```
double VectSharp.Plots.LinearCoordinateSystem2D.MaxY  [get], [set]
```

The maximum Y value.

Definition at line 153 of file CoordinateSystems.cs.

7.87.4.4 MinX

```
double VectSharp.Plots.LinearCoordinateSystem2D.MinX  [get], [set]
```

The minimum X value.

Definition at line 138 of file CoordinateSystems.cs.

7.87.4.5 MinY

```
double VectSharp.Plots.LinearCoordinateSystem2D.MinY  [get], [set]
```

The minimum Y value.

Definition at line 148 of file CoordinateSystems.cs.

7.87.4.6 Resolution

```
double [] VectSharp.Plots.LinearCoordinateSystem2D.Resolution  [get], [set]
```

The maximum difference between two points in data space that appear arbitrarily close in plot space, or some approximation.

Implements VectSharp.Plots.IContinuousCoordinateSystem.

Definition at line 174 of file CoordinateSystems.cs.

7.87.4.7 ScaleX

```
double VectSharp.Plots.LinearCoordinateSystem2D.ScaleX  [get], [set]
```

The X scale.

Definition at line 158 of file CoordinateSystems.cs.

7.87.4.8 ScaleY

```
double VectSharp.Plots.LinearCoordinateSystem2D.ScaleY  [get], [set]
```

The y scale.

Definition at line 163 of file CoordinateSystems.cs.

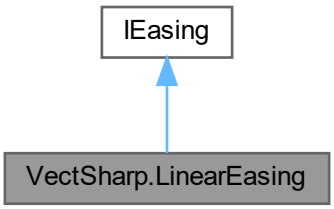
The documentation for this class was generated from the following file:

- VectSharp.Plots/CoordinateSystems.cs

7.88 VectSharp.LinearEasing Class Reference

Describes a linear easing (i.e., no easing).

Inheritance diagram for VectSharp.LinearEasing:



Public Member Functions

- LinearEasing ()

  Creates a new LinearEasing.
- double Ease (double value)

  Applies the easing to the specified transition offset.

Parameters

value	*The transition offset (ranging from 0 to 1).*

Returns

The eased transition offset value.

7.88.1 Detailed Description

Describes a linear easing (i.e., no easing).

Definition at line 1324 of file Animation.cs.

7.88.2 Constructor & Destructor Documentation

7.88.2.1 LinearEasing()

```
VectSharp.LinearEasing.LinearEasing ( )
```

Creates a new LinearEasing.

Definition at line 1329 of file Animation.cs.

7.88.3 Member Function Documentation

7.88.3.1 Ease()

```
double VectSharp.LinearEasing.Ease (
            double value )
```

Applies the easing to the specified transition offset.

Parameters

value	The transition offset (ranging from 0 to 1).

Returns

The eased transition offset value.

Implements VectSharp.IEasing.

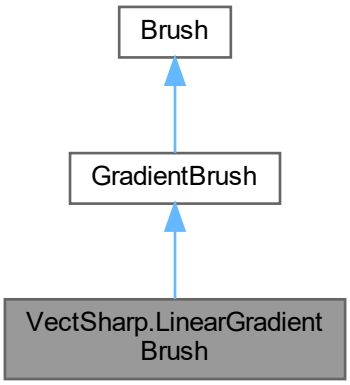
The documentation for this class was generated from the following file:

- VectSharp/Animation.cs

7.89 VectSharp.LinearGradientBrush Class Reference

Represents a brush painting with a linear gradient.

Inheritance diagram for VectSharp.LinearGradientBrush:



Public Member Functions

- LinearGradientBrush (Point startPoint, Point endPoint, IEnumerable< GradientStop > gradientStops)

  Creates a new LinearGradientBrush with the specified start point, end point and gradient stops.
- LinearGradientBrush (Point startPoint, Point endPoint, params GradientStop[ ] gradientStops)

  Creates a new LinearGradientBrush with the specified start point, end point and gradient stops.
- LinearGradientBrush RelativeTo (Graphics referenceGraphics)

  Returns a LinearGradientBrush with the same gradient stops as the current instance, whose start and end point correspond to the points of the current instance in the original reference frame of the referenceGraphics . This involves computing the current transform matrix of the referenceGraphics , inverting it, and applying the inverse matrix to the StartPoint and EndPoint of the current instance.
- override Brush MultiplyOpacity (double opacity)

  Returns a brush corresponding the current instance, with the specified opacity multiplication applied.

Parameters

opacity	*The value that will be used to multiply the opacity of the brush.*

Returns

A brush corresponding the current instance, with the specified opacity multiplication applied.

Properties

- Point StartPoint `[get]`

  The starting point of the gradient. Note that this is relative to the current coordinate system when the gradient is used.
- Point EndPoint `[get]`

  The end point of the gradient. Note that this is relative to the current coordinate system when the gradient is used.

Additional Inherited Members

7.89.1 Detailed Description

Represents a brush painting with a linear gradient.

Definition at line 283 of file Brush.cs.

7.89.2 Constructor & Destructor Documentation

7.89.2.1 LinearGradientBrush() [1/2]

```
VectSharp.LinearGradientBrush.LinearGradientBrush (
            Point startPoint,
            Point endPoint,
            IEnumerable< GradientStop > gradientStops )
```

Creates a new LinearGradientBrush with the specified start point, end point and gradient stops.

Parameters

startPoint	The starting point of the gradient. Note that this is relative to the current coordinate system when the gradient is used.
endPoint	The ending point of the gradient. Note that this is relative to the current coordinate system when the gradient is used.
gradientStops	The colour stops in the gradient.

Definition at line 301 of file Brush.cs.

7.89.2.2 LinearGradientBrush() [2/2]

```
VectSharp.LinearGradientBrush.LinearGradientBrush (
            Point startPoint,
            Point endPoint,
            params GradientStop[] gradientStops )
```

Creates a new LinearGradientBrush with the specified start point, end point and gradient stops.

Parameters

startPoint	The starting point of the gradient. Note that this is relative to the current coordinate system when the gradient is used.
endPoint	The ending point of the gradient. Note that this is relative to the current coordinate system when the gradient is used.
gradientStops	The colour stops in the gradient.

Definition at line 315 of file Brush.cs.

7.89.3 Member Function Documentation

7.89.3.1 MultiplyOpacity()

```
override Brush VectSharp.LinearGradientBrush.MultiplyOpacity (
            double opacity )  [virtual]
```

Returns a brush corresponding the current instance, with the specified *opacity* multiplication applied.

Parameters

opacity	The value that will be used to multiply the opacity of the brush.

Returns

A brush corresponding the current instance, with the specified *opacity* multiplication applied.

Implements VectSharp.Brush.

Definition at line 397 of file Brush.cs.

7.89.3.2 RelativeTo()

```
LinearGradientBrush VectSharp.LinearGradientBrush.RelativeTo (
            Graphics referenceGraphics )
```

Returns a LinearGradientBrush with the same gradient stops as the current instance, whose start and end point correspond to the points of the current instance in the original reference frame of the *referenceGraphics* . This involves computing the current transform matrix of the *referenceGraphics* , inverting it, and applying the inverse matrix to the StartPoint and EndPoint of the current instance.

Parameters

referenceGraphics	The Graphics whose original reference frame is to be used.

Returns

A LinearGradientBrush with the same gradient stops as the current instance, whose start and end point correspond to the points of the current instance in the original reference frame of the *referenceGraphics* .

Definition at line 347 of file Brush.cs.

7.89.4 Property Documentation

7.89.4.1 EndPoint

```
Point VectSharp.LinearGradientBrush.EndPoint  [get]
```

The end point of the gradient. Note that this is relative to the current coordinate system when the gradient is used.

Definition at line 293 of file Brush.cs.

7.89.4.2 StartPoint

```
Point VectSharp.LinearGradientBrush.StartPoint  [get]
```

The starting point of the gradient. Note that this is relative to the current coordinate system when the gradient is used.

Definition at line 288 of file Brush.cs.

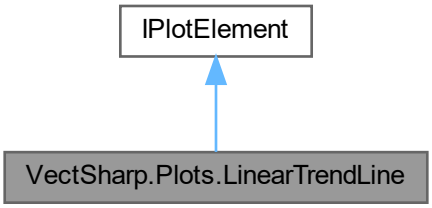
The documentation for this class was generated from the following file:

- VectSharp/Brush.cs

7.90 VectSharp.Plots.LinearTrendLine Class Reference

A plot element that draws a linear trendline with equation `y = a * x + b`.

Inheritance diagram for VectSharp.Plots.LinearTrendLine:



Public Member Functions

- LinearTrendLine (double slope, double intercept, double minX, double minY, double maxX, double maxY, IContinuousCoordinateSystem coordinateSystem)

  Create a new LinearTrendLine instance, specifying the equation parameters.
- LinearTrendLine (IReadOnlyList< IReadOnlyList< double > > data, IContinuousCoordinateSystem coordinateSystem, double? fixedIntercept=null)

  Create a new LinearTrendLine instance, determining the equation parameters by running a regression.
- LinearTrendLine (IReadOnlyList<(double, double)> data, IContinuousCoordinateSystem coordinateSystem, double? fixedIntercept=null)

  Create a new LinearTrendLine instance, determining the equation parameters by running a regression.
- void Plot (Graphics target)

  Draw the plot element on the specified target Graphics.

Parameters

target	*The Graphics on which to draw.*

Properties

- double Slope [get, set]

  The slope of the trendline (a).
- double Intercept [get, set]

  The intercept of the trendline (b).
- double MinX [get, set]

  The minimum X value for which the trendline is plotted.
- double MinY [get, set]

  The minimum Y value for which the trendline is plotted.
- double MaxX [get, set]

  The maximum X value for which the trendline is plotted.
- double MaxY [get, set]

  The maximum Y value for which the trendline is plotted.
- PlotElementPresentationAttributes PresentationAttributes = new PlotElementPresentationAttributes() { LineDash = new LineDash(5, 5, 0), Stroke = Colour.FromRgb(180, 180, 180) } [get, set]

  Presentation attributes for the trendline.
- string Tag [get, set]

  A tag to identify the trendline in the plot.
- IContinuousCoordinateSystem CoordinateSystem [get, set]

  The coordinate system used to transform the points from data space to plot space.

7.90.1 Detailed Description

A plot element that draws a linear trendline with equation `y = a * x + b`.

Definition at line 31 of file Trendlines.cs.

7.90.2 Constructor & Destructor Documentation

7.90.2.1 LinearTrendLine() [1/3]

```
VectSharp.Plots.LinearTrendLine.LinearTrendLine (
            double slope,
            double intercept,
            double minX,
            double minY,
            double maxX,
            double maxY,
            IContinuousCoordinateSystem coordinateSystem )
```

Create a new LinearTrendLine instance, specifying the equation parameters.

Parameters

slope	The slope of the trendline (a).
intercept	The intercept of the trendline (b).
minX	The minimum X value for which the trendline is plotted.
minY	The minimum Y value for which the trendline is plotted.
maxX	The maximum X value for which the trendline is plotted.
maxY	The maximum Y value for which the trendline is plotted.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 89 of file Trendlines.cs.

7.90.2.2 LinearTrendLine() [2/3]

```
VectSharp.Plots.LinearTrendLine.LinearTrendLine (
            IReadOnlyList< IReadOnlyList< double > > data,
            IContinuousCoordinateSystem coordinateSystem,
            double?  fixedIntercept = null )
```

Create a new LinearTrendLine instance, determining the equation parameters by running a regression.

Parameters

data	The data that will be used to determine the equation parameters.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.
fixedIntercept	If this is `null`, the intercept (b) is determined during the regression; otherwise, it is fixed to the specified value.

Definition at line 106 of file Trendlines.cs.

7.90.2.3 LinearTrendLine() [3/3]

```
VectSharp.Plots.LinearTrendLine.LinearTrendLine (
            IReadOnlyList<(double, double)> data,
            IContinuousCoordinateSystem coordinateSystem,
            double?  fixedIntercept = null )
```

Create a new LinearTrendLine instance, determining the equation parameters by running a regression.

Parameters

data	The data that will be used to determine the equation parameters.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.
fixedIntercept	If this is `null`, the intercept (b) is determined during the regression; otherwise, it is fixed to the specified value.

Definition at line 154 of file Trendlines.cs.

7.90.3 Member Function Documentation

7.90.3.1 Plot()

```
void VectSharp.Plots.LinearTrendLine.Plot (
            Graphics target )
```

Draw the plot element on the specified *target* Graphics.

Parameters

target	The Graphics on which to draw.

Implements VectSharp.Plots.IPlotElement.

Definition at line 157 of file Trendlines.cs.

7.90.4 Property Documentation

7.90.4.1 CoordinateSystem

```
IContinuousCoordinateSystem VectSharp.Plots.LinearTrendLine.CoordinateSystem  [get], [set]
```

The coordinate system used to transform the points from data space to plot space.

Implements VectSharp.Plots.IPlotElement.

Definition at line 76 of file Trendlines.cs.

7.90.4.2 Intercept

```
double VectSharp.Plots.LinearTrendLine.Intercept  [get], [set]
```

The intercept of the trendline (b).

Definition at line 41 of file Trendlines.cs.

7.90.4.3 MaxX

```
double VectSharp.Plots.LinearTrendLine.MaxX  [get], [set]
```

The maximum X value for which the trendline is plotted.

Definition at line 56 of file Trendlines.cs.

7.90.4.4 MaxY

```
double VectSharp.Plots.LinearTrendLine.MaxY  [get], [set]
```

The maximum Y value for which the trendline is plotted.

Definition at line 61 of file Trendlines.cs.

7.90.4.5 MinX

```
double VectSharp.Plots.LinearTrendLine.MinX  [get], [set]
```

The minimum X value for which the trendline is plotted.

Definition at line 46 of file Trendlines.cs.

7.90.4.6 MinY

```
double VectSharp.Plots.LinearTrendLine.MinY  [get], [set]
```

The minimum Y value for which the trendline is plotted.

Definition at line 51 of file Trendlines.cs.

7.90.4.7 PresentationAttributes

```
PlotElementPresentationAttributes VectSharp.Plots.LinearTrendLine.PresentationAttributes = new
PlotElementPresentationAttributes() { LineDash = new LineDash(5, 5, 0), Stroke = Colour.FromRgb(180,
180, 180) }  [get], [set]
```

Presentation attributes for the trendline.

Definition at line 66 of file Trendlines.cs.

7.90.4.8 Slope

```
double VectSharp.Plots.LinearTrendLine.Slope  [get], [set]
```

The slope of the trendline (a).

Definition at line 36 of file Trendlines.cs.

7.90.4.9 Tag

```
string VectSharp.Plots.LinearTrendLine.Tag  [get], [set]
```

A tag to identify the trendline in the plot.

Definition at line 71 of file Trendlines.cs.

The documentation for this class was generated from the following file:

- VectSharp.Plots/Trendlines.cs

7.91 VectSharp.LineDash Struct Reference

Represents instructions on how to paint a dashed line.

Public Member Functions

- LineDash (double unitsOn, double unitsOff, double phase)
  Define a new line dash pattern.

Public Attributes

- double UnitsOn
  Length of the "on" (painted) segment.
- double UnitsOff
  Length of the "off" (not painted) segment.
- double Phase
  Position in the dash pattern at which the line starts.

Static Public Attributes

- static LineDash SolidLine = new LineDash(0, 0, 0)
  A solid (not dashed) line

7.91.1 Detailed Description

Represents instructions on how to paint a dashed line.

Definition at line 112 of file Enums.cs.

7.91.2 Constructor & Destructor Documentation

7.91.2.1 LineDash()

```
VectSharp.LineDash.LineDash (
            double unitsOn,
            double unitsOff,
            double phase )
```

Define a new line dash pattern.

Parameters

unitsOn	The length of the "on" (painted) segment.
unitsOff	The length of the "off" (not painted) segment.
phase	The position in the dash pattern at which the line starts.

Definition at line 140 of file Enums.cs.

7.91.3 Member Data Documentation

7.91.3.1 Phase

```
double VectSharp.LineDash.Phase
```

Position in the dash pattern at which the line starts.

Definition at line 132 of file Enums.cs.

7.91.3.2 SolidLine

```
LineDash VectSharp.LineDash.SolidLine = new LineDash(0, 0, 0)  [static]
```

A solid (not dashed) line

Definition at line 117 of file Enums.cs.

7.91.3.3 UnitsOff

```
double VectSharp.LineDash.UnitsOff
```

Length of the "off" (not painted) segment.

Definition at line 127 of file Enums.cs.

7.91.3.4 UnitsOn

```
double VectSharp.LineDash.UnitsOn
```

Length of the "on" (painted) segment.

Definition at line 122 of file Enums.cs.

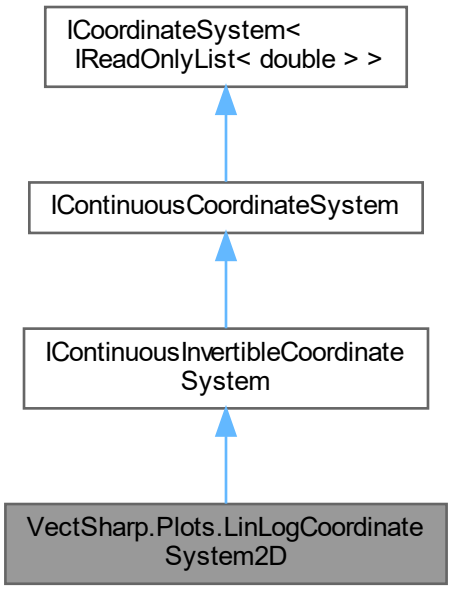
The documentation for this struct was generated from the following file:

- VectSharp/Enums.cs

7.92 VectSharp.Plots.LinLogCoordinateSystem2D Class Reference

Represents a semi-logarithmic coordinate system with a logarithmic transformation on the X axis.

Inheritance diagram for VectSharp.Plots.LinLogCoordinateSystem2D:



Public Member Functions

- bool IsDirectionStraight (IReadOnlyList< double > direction)

  Determines whether points aligned along direction in data space are also aligned along some line in plot space.

Parameters

direction	*The direction in data space along which the points should be aligned.*

Returns

`true` *if any two points aligned along direction in data space are also aligned along some line in plot space,* `false` *otherwise.*

- LinLogCoordinateSystem2D (double minX, double maxX, double minY, double maxY, double scaleX, double scaleY)

  Creates a new LinLogCoordinateSystem2D manually specifying the parameter values.

- LinLogCoordinateSystem2D (IReadOnlyList< IReadOnlyList< double > > data, double scaleX=350, double scaleY=250)

  Creates a new LinLogCoordinateSystem2D determining the value range from the data .

- LinLogCoordinateSystem2D (double[,] data, double scaleX=350, double scaleY=250)

  Creates a new LinLogCoordinateSystem2D determining the value range from the data .

- double[ ] ToDataCoordinates (Point plotPoint)

Transform a point in plot space back into data space.

Parameters

plotPoint	*The point in plot space.*

Returns

The point in data space corresponding to the specified point in plot space.

- Point ToPlotCoordinates (IReadOnlyList< double > dataPoint)
- Point ToPlotCoordinates (Point dataPoint)

  Transforms the specified dataPoint into a plot point.
- double[ ] GetAround (IReadOnlyList< double > point, IReadOnlyList< double > direction)

  Gets a data element that is arbitrarily close to the specified point , along the specified direction .

Parameters

point	*The point close to which the returned data element should be.*
direction	*The direction (in data space) along which the returned point should be.*

Returns

A data element that is arbitrarily close to the specified point , along the specified direction .

Properties

- double MinX `[get, set]`

  The minimum X value.
- double MaxX `[get, set]`

  The maximum X value.
- double MinY `[get, set]`

  The minimum Y value (in logarithmic scale).
- double MaxY `[get, set]`

  The maximum Y value (in logarithmic scale).
- double ScaleX `[get, set]`

  The X scale.
- double ScaleY `[get, set]`

  The y scale.
- bool IsLinear `[get]`

  Gets whether the current coordinate system is linear along all directions.
- double[ ] Resolution `[get, set]`

  The maximum difference between two points in data space that appear arbitrarily close in plot space, or some approximation.

7.92.1 Detailed Description

Represents a semi-logarithmic coordinate system with a logarithmic transformation on the X axis.

Definition at line 719 of file CoordinateSystems.cs.

7.92.2 Constructor & Destructor Documentation

7.92.2.1 LinLogCoordinateSystem2D() [1/3]

```
VectSharp.Plots.LinLogCoordinateSystem2D.LinLogCoordinateSystem2D (
            double minX,
            double maxX,
            double minY,
            double maxY,
            double scaleX,
            double scaleY )
```

Creates a new LinLogCoordinateSystem2D manually specifying the parameter values.

Parameters

minX	The minimum X value.
maxX	The maximum X value.
minY	The minimum Y value.
maxY	The maximum Y value.
scaleX	The X scale.
scaleY	The Y scale.

Definition at line 799 of file CoordinateSystems.cs.

7.92.2.2 LinLogCoordinateSystem2D() [2/3]

```
VectSharp.Plots.LinLogCoordinateSystem2D.LinLogCoordinateSystem2D (
            IReadOnlyList< IReadOnlyList< double > > data,
            double scaleX = 350,
            double scaleY = 250 )
```

Creates a new LinLogCoordinateSystem2D determining the value range from the *data* .

Parameters

data	The data from which the value range should be determined.
scaleX	The X scale.
scaleY	The Y scale.

Definition at line 815 of file CoordinateSystems.cs.

7.92.2.3 LinLogCoordinateSystem2D() [3/3]

```
VectSharp.Plots.LinLogCoordinateSystem2D.LinLogCoordinateSystem2D (
            double data[,],
            double scaleX = 350,
            double scaleY = 250 )
```

Creates a new LinLogCoordinateSystem2D determining the value range from the *data* .

Parameters

data	The data from which the value range should be determined.
scaleX	The X scale.
scaleY	The Y scale.

Definition at line 856 of file CoordinateSystems.cs.

7.92.3 Member Function Documentation

7.92.3.1 GetAround()

```
double[] VectSharp.Plots.LinLogCoordinateSystem2D.GetAround (
            IReadOnlyList< double > point,
            IReadOnlyList< double > direction )
```

Gets a data element that is arbitrarily close to the specified *point* , along the specified *direction* .

Parameters

point	The point close to which the returned data element should be.
direction	The direction (in data space) along which the returned point should be.

Returns

A data element that is arbitrarily close to the specified *point* , along the specified *direction* .

Implements VectSharp.Plots.IContinuousCoordinateSystem.

Definition at line 914 of file CoordinateSystems.cs.

7.92.3.2 IsDirectionStraight()

```
bool VectSharp.Plots.LinLogCoordinateSystem2D.IsDirectionStraight (
            IReadOnlyList< double > direction )
```

Determines whether points aligned along *direction* in data space are also aligned along some line in plot space.

Parameters

direction	The direction in data space along which the points should be aligned.

Returns

`true` if any two points aligned along *direction* in data space are also aligned along some line in plot space, `false` otherwise.

Implements VectSharp.Plots.IContinuousCoordinateSystem.

Definition at line 755 of file CoordinateSystems.cs.

7.92.3.3 ToDataCoordinates()

```
double[] VectSharp.Plots.LinLogCoordinateSystem2D.ToDataCoordinates (
            Point plotPoint )
```

Transform a point in plot space back into data space.

Parameters

plotPoint	The point in plot space.

Returns

The point in data space corresponding to the specified point in plot space.

Implements VectSharp.Plots.IContinuousInvertibleCoordinateSystem.

Definition at line 892 of file CoordinateSystems.cs.

7.92.3.4 ToPlotCoordinates() [1/2]

```
Point VectSharp.Plots.LinLogCoordinateSystem2D.ToPlotCoordinates (
            IReadOnlyList< double > dataPoint )
```

Definition at line 898 of file CoordinateSystems.cs.

7.92.3.5 ToPlotCoordinates() [2/2]

```
Point VectSharp.Plots.LinLogCoordinateSystem2D.ToPlotCoordinates (
            Point dataPoint )
```

Transforms the specified *dataPoint* into a plot point.

Parameters

dataPoint	The data whose plot coordinates should be determined.

Returns

A Point representing the *dataPoint* in plot space.

Definition at line 908 of file CoordinateSystems.cs.

7.92.4 Property Documentation

7.92.4.1 IsLinear

```
bool VectSharp.Plots.LinLogCoordinateSystem2D.IsLinear  [get]
```

Gets whether the current coordinate system is linear along all directions.

Implements VectSharp.Plots.IContinuousCoordinateSystem.

Definition at line 752 of file CoordinateSystems.cs.

7.92.4.2 MaxX

```
double VectSharp.Plots.LinLogCoordinateSystem2D.MaxX  [get], [set]
```

The maximum X value.

Definition at line 729 of file CoordinateSystems.cs.

7.92.4.3 MaxY

```
double VectSharp.Plots.LinLogCoordinateSystem2D.MaxY  [get], [set]
```

The maximum Y value (in logarithmic scale).

Definition at line 739 of file CoordinateSystems.cs.

7.92.4.4 MinX

```
double VectSharp.Plots.LinLogCoordinateSystem2D.MinX  [get], [set]
```

The minimum X value.

Definition at line 724 of file CoordinateSystems.cs.

7.92.4.5 MinY

```
double VectSharp.Plots.LinLogCoordinateSystem2D.MinY  [get], [set]
```

The minimum Y value (in logarithmic scale).

Definition at line 734 of file CoordinateSystems.cs.

7.92.4.6 Resolution

```
double [] VectSharp.Plots.LinLogCoordinateSystem2D.Resolution  [get], [set]
```

The maximum difference between two points in data space that appear arbitrarily close in plot space, or some approximation.

Implements VectSharp.Plots.IContinuousCoordinateSystem.

Definition at line 770 of file CoordinateSystems.cs.

7.92.4.7 ScaleX

```
double VectSharp.Plots.LinLogCoordinateSystem2D.ScaleX  [get], [set]
```

The X scale.

Definition at line 744 of file CoordinateSystems.cs.

7.92.4.8 ScaleY

```
double VectSharp.Plots.LinLogCoordinateSystem2D.ScaleY  [get], [set]
```

The y scale.

Definition at line 749 of file CoordinateSystems.cs.

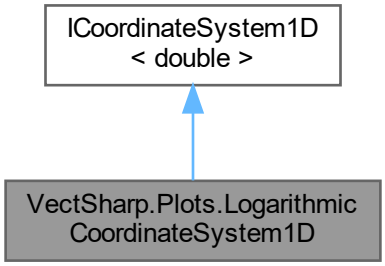
The documentation for this class was generated from the following file:

- VectSharp.Plots/CoordinateSystems.cs

7.93 VectSharp.Plots.LogarithmicCoordinateSystem1D Class Reference

Represents a 1-D logarithmic coordinate system.

Inheritance diagram for VectSharp.Plots.LogarithmicCoordinateSystem1D:



Public Member Functions

- LogarithmicCoordinateSystem1D (double min, double max, double scale)

  Creates a new LogarithmicCoordinateSystem1D, manually specifying the parameters.
- LogarithmicCoordinateSystem1D (IReadOnlyList< double > data, double scale=350)

  Creates a new LogarithmicCoordinateSystem1D determining the value range from the data .
- double ToPlotCoordinates (double dataPoint)

Properties

- double Min `[get, set]`

  The minimum value (in logarithmic scale).
- double Max `[get, set]`

  The maximum value (in logarithmic scale).
- double Scale `[get, set]`

  The scale factor.

7.93.1 Detailed Description

Represents a 1-D logarithmic coordinate system.

Definition at line 987 of file CoordinateSystems.cs.

7.93.2 Constructor & Destructor Documentation

7.93.2.1 LogarithmicCoordinateSystem1D() [1/2]

```
VectSharp.Plots.LogarithmicCoordinateSystem1D.LogarithmicCoordinateSystem1D (
            double min,
            double max,
            double scale )
```

Creates a new LogarithmicCoordinateSystem1D, manually specifying the parameters.

Parameters

min	The minimum value.
max	The maximum value.
scale	The scale factor.

Definition at line 1010 of file CoordinateSystems.cs.

7.93.2.2 LogarithmicCoordinateSystem1D() [2/2]

```
VectSharp.Plots.LogarithmicCoordinateSystem1D.LogarithmicCoordinateSystem1D (
            IReadOnlyList< double > data,
            double scale = 350 )
```

Creates a new LogarithmicCoordinateSystem1D determining the value range from the *data* .

Parameters

data	The data from which the value range should be determined.
scale	The scale factor.

Definition at line 1022 of file CoordinateSystems.cs.

7.93.3 Member Function Documentation

7.93.3.1 ToPlotCoordinates()

```
double VectSharp.Plots.LogarithmicCoordinateSystem1D.ToPlotCoordinates (
            double dataPoint )
```

Definition at line 1045 of file CoordinateSystems.cs.

7.93.4 Property Documentation

7.93.4.1 Max

```
double VectSharp.Plots.LogarithmicCoordinateSystem1D.Max  [get], [set]
```

The maximum value (in logarithmic scale).

Definition at line 997 of file CoordinateSystems.cs.

7.93.4.2 Min

```
double VectSharp.Plots.LogarithmicCoordinateSystem1D.Min  [get], [set]
```

The minimum value (in logarithmic scale).

Definition at line 992 of file CoordinateSystems.cs.

7.93.4.3 Scale

```
double VectSharp.Plots.LogarithmicCoordinateSystem1D.Scale  [get], [set]
```

The scale factor.

Definition at line 1002 of file CoordinateSystems.cs.

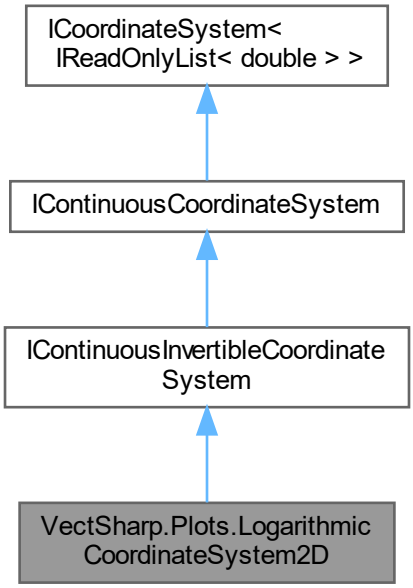
The documentation for this class was generated from the following file:

- VectSharp.Plots/CoordinateSystems.cs

7.94 VectSharp.Plots.LogarithmicCoordinateSystem2D Class Reference

Represents a logarithmic coordinate system.

Inheritance diagram for VectSharp.Plots.LogarithmicCoordinateSystem2D:



Public Member Functions

- bool IsDirectionStraight (IReadOnlyList< double > direction)

  Determines whether points aligned along direction in data space are also aligned along some line in plot space.

Parameters

direction	*The direction in data space along which the points should be aligned.*

Returns

`true` *if any two points aligned along direction in data space are also aligned along some line in plot space,* `false` *otherwise.*

- LogarithmicCoordinateSystem2D (double minX, double maxX, double minY, double maxY, double scaleX, double scaleY)

  Creates a new LogarithmicCoordinateSystem2D manually specifying the parameter values.

- LogarithmicCoordinateSystem2D (IReadOnlyList< IReadOnlyList< double > > data, double scaleX=350, double scaleY=250)

  Creates a new LogarithmicCoordinateSystem2D determining the value range from the data .

- LogarithmicCoordinateSystem2D (double[,] data, double scaleX=350, double scaleY=250)

  Creates a new LogarithmicCoordinateSystem2D determining the value range from the data .

- double[ ] ToDataCoordinates (Point plotPoint)

  Transform a point in plot space back into data space.

Parameters

plotPoint	*The point in plot space.*

Returns

The point in data space corresponding to the specified point in plot space.

- Point ToPlotCoordinates (IReadOnlyList< double > dataPoint)
- Point ToPlotCoordinates (Point dataPoint)

  Transforms the specified dataPoint into a plot point.
- double[ ] GetAround (IReadOnlyList< double > point, IReadOnlyList< double > direction)

  Gets a data element that is arbitrarily close to the specified point , along the specified direction .

Parameters

point	*The point close to which the returned data element should be.*
direction	*The direction (in data space) along which the returned point should be.*

Returns

A data element that is arbitrarily close to the specified point , along the specified direction .

Properties

- double MinX `[get, set]`

  The minimum X value (in logarithmic scale).
- double MaxX `[get, set]`

  The maximum X value (in logarithmic scale).
- double MinY `[get, set]`

  The minimum Y value (in logarithmic scale).
- double MaxY `[get, set]`

  The maximum Y value (in logarithmic scale).
- double ScaleX `[get, set]`

  The X scale.
- double ScaleY `[get, set]`

  The y scale.
- bool IsLinear `[get]`

  Gets whether the current coordinate system is linear along all directions.
- double[ ] Resolution `[get, set]`

  The maximum difference between two points in data space that appear arbitrarily close in plot space, or some approximation.

7.94.1 Detailed Description

Represents a logarithmic coordinate system.

Definition at line 310 of file CoordinateSystems.cs.

7.94.2 Constructor & Destructor Documentation

7.94.2.1 LogarithmicCoordinateSystem2D() [1/3]

```
VectSharp.Plots.LogarithmicCoordinateSystem2D.LogarithmicCoordinateSystem2D (
            double minX,
            double maxX,
            double minY,
            double maxY,
            double scaleX,
            double scaleY )
```

Creates a new LogarithmicCoordinateSystem2D manually specifying the parameter values.

Parameters

minX	The minimum X value.
maxX	The maximum X value.
minY	The minimum Y value.
maxY	The maximum Y value.
scaleX	The X scale.
scaleY	The Y scale.

Definition at line 390 of file CoordinateSystems.cs.

7.94.2.2 LogarithmicCoordinateSystem2D() [2/3]

```
VectSharp.Plots.LogarithmicCoordinateSystem2D.LogarithmicCoordinateSystem2D (
            IReadOnlyList< IReadOnlyList< double > > data,
            double scaleX = 350,
            double scaleY = 250 )
```

Creates a new LogarithmicCoordinateSystem2D determining the value range from the *data* .

Parameters

data	The data from which the value range should be determined.
scaleX	The X scale.
scaleY	The Y scale.

Definition at line 406 of file CoordinateSystems.cs.

7.94.2.3 LogarithmicCoordinateSystem2D() [3/3]

```
VectSharp.Plots.LogarithmicCoordinateSystem2D.LogarithmicCoordinateSystem2D (
            double data[,],
            double scaleX = 350,
            double scaleY = 250 )
```

Creates a new LogarithmicCoordinateSystem2D determining the value range from the *data* .

Parameters

data	The data from which the value range should be determined.
scaleX	The X scale.
scaleY	The Y scale.

Definition at line 448 of file CoordinateSystems.cs.

7.94.3 Member Function Documentation

7.94.3.1 GetAround()

```
double[] VectSharp.Plots.LogarithmicCoordinateSystem2D.GetAround (
            IReadOnlyList< double > point,
            IReadOnlyList< double > direction )
```

Gets a data element that is arbitrarily close to the specified *point* , along the specified *direction* .

Parameters

point	The point close to which the returned data element should be.
direction	The direction (in data space) along which the returned point should be.

Returns

A data element that is arbitrarily close to the specified *point* , along the specified *direction* .

Implements VectSharp.Plots.IContinuousCoordinateSystem.

Definition at line 506 of file CoordinateSystems.cs.

7.94.3.2 IsDirectionStraight()

```
bool VectSharp.Plots.LogarithmicCoordinateSystem2D.IsDirectionStraight (
            IReadOnlyList< double > direction )
```

Determines whether points aligned along *direction* in data space are also aligned along some line in plot space.

Parameters

direction	The direction in data space along which the points should be aligned.

Returns

`true` if any two points aligned along *direction* in data space are also aligned along some line in plot space, `false` otherwise.

Implements VectSharp.Plots.IContinuousCoordinateSystem.

Definition at line 346 of file CoordinateSystems.cs.

7.94.3.3 ToDataCoordinates()

```
double[] VectSharp.Plots.LogarithmicCoordinateSystem2D.ToDataCoordinates (
            Point plotPoint )
```

Transform a point in plot space back into data space.

Parameters

plotPoint	The point in plot space.

Returns

The point in data space corresponding to the specified point in plot space.

Implements VectSharp.Plots.IContinuousInvertibleCoordinateSystem.

Definition at line 484 of file CoordinateSystems.cs.

7.94.3.4 ToPlotCoordinates() [1/2]

```
Point VectSharp.Plots.LogarithmicCoordinateSystem2D.ToPlotCoordinates (
            IReadOnlyList< double > dataPoint )
```

Definition at line 490 of file CoordinateSystems.cs.

7.94.3.5 ToPlotCoordinates() [2/2]

```
Point VectSharp.Plots.LogarithmicCoordinateSystem2D.ToPlotCoordinates (
            Point dataPoint )
```

Transforms the specified *dataPoint* into a plot point.

Parameters

dataPoint	The data whose plot coordinates should be determined.

Returns

A Point representing the *dataPoint* in plot space.

Definition at line 500 of file CoordinateSystems.cs.

7.94.4 Property Documentation

7.94.4.1 IsLinear

```
bool VectSharp.Plots.LogarithmicCoordinateSystem2D.IsLinear  [get]
```

Gets whether the current coordinate system is linear along all directions.

Implements VectSharp.Plots.IContinuousCoordinateSystem.

Definition at line 343 of file CoordinateSystems.cs.

7.94.4.2 MaxX

```
double VectSharp.Plots.LogarithmicCoordinateSystem2D.MaxX  [get], [set]
```

The maximum X value (in logarithmic scale).

Definition at line 320 of file CoordinateSystems.cs.

7.94.4.3 MaxY

```
double VectSharp.Plots.LogarithmicCoordinateSystem2D.MaxY  [get], [set]
```

The maximum Y value (in logarithmic scale).

Definition at line 330 of file CoordinateSystems.cs.

7.94.4.4 MinX

```
double VectSharp.Plots.LogarithmicCoordinateSystem2D.MinX  [get], [set]
```

The minimum X value (in logarithmic scale).

Definition at line 315 of file CoordinateSystems.cs.

7.94.4.5 MinY

```
double VectSharp.Plots.LogarithmicCoordinateSystem2D.MinY  [get], [set]
```

The minimum Y value (in logarithmic scale).

Definition at line 325 of file CoordinateSystems.cs.

7.94.4.6 Resolution

```
double [] VectSharp.Plots.LogarithmicCoordinateSystem2D.Resolution  [get], [set]
```

The maximum difference between two points in data space that appear arbitrarily close in plot space, or some approximation.

Implements VectSharp.Plots.IContinuousCoordinateSystem.

Definition at line 361 of file CoordinateSystems.cs.

7.94.4.7 ScaleX

```
double VectSharp.Plots.LogarithmicCoordinateSystem2D.ScaleX  [get], [set]
```

The X scale.

Definition at line 335 of file CoordinateSystems.cs.

7.94.4.8 ScaleY

```
double VectSharp.Plots.LogarithmicCoordinateSystem2D.ScaleY  [get], [set]
```

The y scale.

Definition at line 340 of file CoordinateSystems.cs.

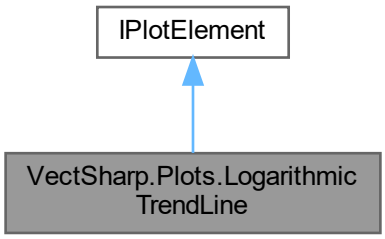
The documentation for this class was generated from the following file:

- VectSharp.Plots/CoordinateSystems.cs

7.95 VectSharp.Plots.LogarithmicTrendLine Class Reference

A plot element that draws a logarithmic trendline with equation `y = a * Ln(x) + b`.

Inheritance diagram for VectSharp.Plots.LogarithmicTrendLine:



Public Member Functions

- LogarithmicTrendLine (double slope, double intercept, double minX, double minY, double maxX, double maxY, IContinuousCoordinateSystem coordinateSystem)

  Create a new LogarithmicTrendLine instance, specifying the equation parameters.
- LogarithmicTrendLine (IReadOnlyList< IReadOnlyList< double > > data, IContinuousCoordinateSystem coordinateSystem, double? fixedIntercept=null)

  Create a new LogarithmicTrendLine instance, determining the equation parameters by running a regression.
- LogarithmicTrendLine (IReadOnlyList<(double, double)> data, IContinuousCoordinateSystem coordinate↩ System, double? fixedIntercept=null)

  Create a new LogarithmicTrendLine instance, determining the equation parameters by running a regression.
- void Plot (Graphics target)

  Draw the plot element on the specified target Graphics.

Parameters

target	*The Graphics on which to draw.*

Properties

- double Slope `[get, set]`

  The slope of the trendline (a).
- double Intercept `[get, set]`

  The intercept of the trendline (b).
- double MinX `[get, set]`

  The minimum X value for which the trendline is plotted.
- double MinY `[get, set]`

  The minimum Y value for which the trendline is plotted.
- double MaxX `[get, set]`

The maximum X value for which the trendline is plotted.

- double MaxY `[get, set]`

  The maximum Y value for which the trendline is plotted.

- PlotElementPresentationAttributes PresentationAttributes = new PlotElementPresentationAttributes() { LineDash = new LineDash(5, 5, 0), Stroke = Colour.FromRgb(180, 180, 180) } `[get, set]`

  Presentation attributes for the trendline.

- string Tag `[get, set]`

  A tag to identify the trendline in the plot.

- IContinuousCoordinateSystem CoordinateSystem `[get, set]`

  The coordinate system used to transform the points from data space to plot space.

7.95.1 Detailed Description

A plot element that draws a logarithmic trendline with equation `y = a * Ln(x) + b`.

Definition at line 474 of file Trendlines.cs.

7.95.2 Constructor & Destructor Documentation

7.95.2.1 LogarithmicTrendLine() [1/3]

```
VectSharp.Plots.LogarithmicTrendLine.LogarithmicTrendLine (
            double slope,
            double intercept,
            double minX,
            double minY,
            double maxX,
            double maxY,
            IContinuousCoordinateSystem coordinateSystem )
```

Create a new LogarithmicTrendLine instance, specifying the equation parameters.

Parameters

slope	The slope of the trendline (a).
intercept	The intercept of the trendline (b).
minX	The minimum X value for which the trendline is plotted.
minY	The minimum Y value for which the trendline is plotted.
maxX	The maximum X value for which the trendline is plotted.
maxY	The maximum Y value for which the trendline is plotted.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 532 of file Trendlines.cs.

7.95.2.2 LogarithmicTrendLine() [2/3]

```
VectSharp.Plots.LogarithmicTrendLine.LogarithmicTrendLine (
            IReadOnlyList< IReadOnlyList< double > > data,
            IContinuousCoordinateSystem coordinateSystem,
            double?  fixedIntercept = null )
```

Create a new LogarithmicTrendLine instance, determining the equation parameters by running a regression.

Parameters

data	The data that will be used to determine the equation parameters.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.
fixedIntercept	If this is `null`, the intercept (b) is determined during the regression; otherwise, it is fixed to the specified value.

Definition at line 549 of file Trendlines.cs.

7.95.2.3 LogarithmicTrendLine() [3/3]

```
VectSharp.Plots.LogarithmicTrendLine.LogarithmicTrendLine (
            IReadOnlyList<(double, double)> data,
            IContinuousCoordinateSystem coordinateSystem,
            double?  fixedIntercept = null )
```

Create a new LogarithmicTrendLine instance, determining the equation parameters by running a regression.

Parameters

data	The data that will be used to determine the equation parameters.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.
fixedIntercept	If this is `null`, the intercept (b) is determined during the regression; otherwise, it is fixed to the specified value.

Definition at line 596 of file Trendlines.cs.

7.95.3 Member Function Documentation

7.95.3.1 Plot()

```
void VectSharp.Plots.LogarithmicTrendLine.Plot (
            Graphics target )
```

Draw the plot element on the specified *target* Graphics.

Parameters

target	The Graphics on which to draw.

Implements VectSharp.Plots.IPlotElement.

Definition at line 599 of file Trendlines.cs.

7.95.4 Property Documentation

7.95.4.1 CoordinateSystem

```
IContinuousCoordinateSystem VectSharp.Plots.LogarithmicTrendLine.CoordinateSystem  [get], [set]
```

The coordinate system used to transform the points from data space to plot space.

Implements VectSharp.Plots.IPlotElement.

Definition at line 519 of file Trendlines.cs.

7.95.4.2 Intercept

```
double VectSharp.Plots.LogarithmicTrendLine.Intercept  [get], [set]
```

The intercept of the trendline (b).

Definition at line 484 of file Trendlines.cs.

7.95.4.3 MaxX

```
double VectSharp.Plots.LogarithmicTrendLine.MaxX  [get], [set]
```

The maximum X value for which the trendline is plotted.

Definition at line 499 of file Trendlines.cs.

7.95.4.4 MaxY

```
double VectSharp.Plots.LogarithmicTrendLine.MaxY  [get], [set]
```

The maximum Y value for which the trendline is plotted.

Definition at line 504 of file Trendlines.cs.

7.95.4.5 MinX

```
double VectSharp.Plots.LogarithmicTrendLine.MinX  [get], [set]
```

The minimum X value for which the trendline is plotted.

Definition at line 489 of file Trendlines.cs.

7.95.4.6 MinY

```
double VectSharp.Plots.LogarithmicTrendLine.MinY  [get], [set]
```

The minimum Y value for which the trendline is plotted.

Definition at line 494 of file Trendlines.cs.

7.95.4.7 PresentationAttributes

```
PlotElementPresentationAttributes VectSharp.Plots.LogarithmicTrendLine.PresentationAttributes
= new PlotElementPresentationAttributes() { LineDash = new LineDash(5, 5, 0), Stroke = Colour.FromRgb(180,
180, 180) }  [get], [set]
```

Presentation attributes for the trendline.

Definition at line 509 of file Trendlines.cs.

7.95.4.8 Slope

```
double VectSharp.Plots.LogarithmicTrendLine.Slope  [get], [set]
```

The slope of the trendline (a).

Definition at line 479 of file Trendlines.cs.

7.95.4.9 Tag

```
string VectSharp.Plots.LogarithmicTrendLine.Tag  [get], [set]
```

A tag to identify the trendline in the plot.

Definition at line 514 of file Trendlines.cs.

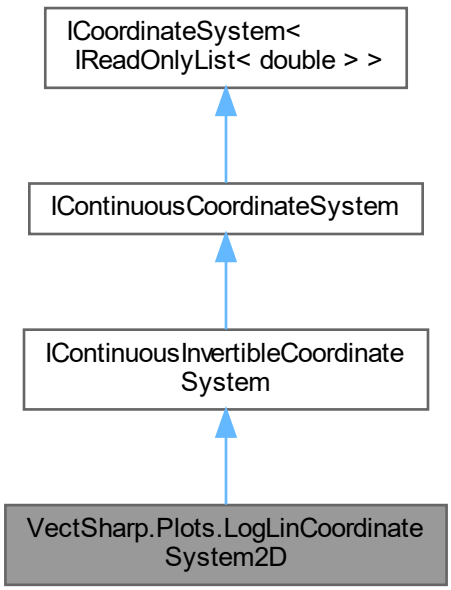
The documentation for this class was generated from the following file:

- VectSharp.Plots/Trendlines.cs

7.96 VectSharp.Plots.LogLinCoordinateSystem2D Class Reference

Represents a semi-logarithmic coordinate system with a logarithmic transformation on the Y axis.

Inheritance diagram for VectSharp.Plots.LogLinCoordinateSystem2D:



Public Member Functions

- bool IsDirectionStraight (IReadOnlyList< double > direction)

  Determines whether points aligned along direction in data space are also aligned along some line in plot space.

Parameters

direction	*The direction in data space along which the points should be aligned.*

Returns

`true` if any two points aligned along direction in data space are also aligned along some line in plot space, `false` otherwise.

- LogLinCoordinateSystem2D (double minX, double maxX, double minY, double maxY, double scaleX, double scaleY)

  Creates a new LogLinCoordinateSystem2D manually specifying the parameter values.
- LogLinCoordinateSystem2D (IReadOnlyList< IReadOnlyList< double > > data, double scaleX=350, double scaleY=250)

  Creates a new LogLinCoordinateSystem2D determining the value range from the data .
- LogLinCoordinateSystem2D (double[,] data, double scaleX=350, double scaleY=250)

  Creates a new LogLinCoordinateSystem2D determining the value range from the data .
- double[ ] ToDataCoordinates (Point plotPoint)

  Transform a point in plot space back into data space.

Parameters

plotPoint	*The point in plot space.*

Returns

The point in data space corresponding to the specified point in plot space.

- Point ToPlotCoordinates (IReadOnlyList< double > dataPoint)
- Point ToPlotCoordinates (Point dataPoint)

  Transforms the specified dataPoint into a plot point.
- double[ ] GetAround (IReadOnlyList< double > point, IReadOnlyList< double > direction)

  Gets a data element that is arbitrarily close to the specified point , along the specified direction .

Parameters

point	*The point close to which the returned data element should be.*
direction	*The direction (in data space) along which the returned point should be.*

Returns

A data element that is arbitrarily close to the specified point , along the specified direction .

Properties

- double MinX `[get, set]`

  The minimum X value.
- double MaxX `[get, set]`

  The maximum X value.
- double MinY `[get, set]`

  The minimum Y value (in logarithmic scale).
- double MaxY `[get, set]`

  The maximum Y value (in logarithmic scale).
- double ScaleX `[get, set]`

  The X scale.
- double ScaleY `[get, set]`

  The y scale.
- bool IsLinear `[get]`

  Gets whether the current coordinate system is linear along all directions.
- double[ ] Resolution `[get, set]`

  The maximum difference between two points in data space that appear arbitrarily close in plot space, or some approximation.

7.96.1 Detailed Description

Represents a semi-logarithmic coordinate system with a logarithmic transformation on the Y axis.

Definition at line 515 of file CoordinateSystems.cs.

7.96.2 Constructor & Destructor Documentation

7.96.2.1 LogLinCoordinateSystem2D() [1/3]

```
VectSharp.Plots.LogLinCoordinateSystem2D.LogLinCoordinateSystem2D (
            double minX,
            double maxX,
            double minY,
            double maxY,
            double scaleX,
            double scaleY )
```

Creates a new LogLinCoordinateSystem2D manually specifying the parameter values.

Parameters

minX	The minimum X value.
maxX	The maximum X value.
minY	The minimum Y value.
maxY	The maximum Y value.
scaleX	The X scale.
scaleY	The Y scale.

Definition at line 595 of file CoordinateSystems.cs.

7.96.2.2 LogLinCoordinateSystem2D() [2/3]

```
VectSharp.Plots.LogLinCoordinateSystem2D.LogLinCoordinateSystem2D (
            IReadOnlyList< IReadOnlyList< double > > data,
            double scaleX = 350,
            double scaleY = 250 )
```

Creates a new LogLinCoordinateSystem2D determining the value range from the *data* .

Parameters

data	The data from which the value range should be determined.
scaleX	The X scale.
scaleY	The Y scale.

Definition at line 611 of file CoordinateSystems.cs.

7.96.2.3 LogLinCoordinateSystem2D() [3/3]

```
VectSharp.Plots.LogLinCoordinateSystem2D.LogLinCoordinateSystem2D (
            double data[,],
            double scaleX = 350,
            double scaleY = 250 )
```

Creates a new LogLinCoordinateSystem2D determining the value range from the *data* .

Parameters

data	The data from which the value range should be determined.
scaleX	The X scale.
scaleY	The Y scale.

Definition at line 652 of file CoordinateSystems.cs.

7.96.3 Member Function Documentation

7.96.3.1 GetAround()

```
double[] VectSharp.Plots.LogLinCoordinateSystem2D.GetAround (
            IReadOnlyList< double > point,
            IReadOnlyList< double > direction )
```

Gets a data element that is arbitrarily close to the specified *point* , along the specified *direction* .

Parameters

point	The point close to which the returned data element should be.
direction	The direction (in data space) along which the returned point should be.

Returns

A data element that is arbitrarily close to the specified *point* , along the specified *direction* .

Implements VectSharp.Plots.IContinuousCoordinateSystem.

Definition at line 710 of file CoordinateSystems.cs.

7.96.3.2 IsDirectionStraight()

```
bool VectSharp.Plots.LogLinCoordinateSystem2D.IsDirectionStraight (
            IReadOnlyList< double > direction )
```

Determines whether points aligned along *direction* in data space are also aligned along some line in plot space.

Parameters

direction	The direction in data space along which the points should be aligned.

Returns

`true` if any two points aligned along *direction* in data space are also aligned along some line in plot space, `false` otherwise.

Implements VectSharp.Plots.IContinuousCoordinateSystem.

Definition at line 551 of file CoordinateSystems.cs.

7.96.3.3 ToDataCoordinates()

```
double[] VectSharp.Plots.LogLinCoordinateSystem2D.ToDataCoordinates (
            Point plotPoint )
```

Transform a point in plot space back into data space.

Parameters

plotPoint	The point in plot space.

Returns

The point in data space corresponding to the specified point in plot space.

Implements VectSharp.Plots.IContinuousInvertibleCoordinateSystem.

Definition at line 688 of file CoordinateSystems.cs.

7.96.3.4 ToPlotCoordinates() [1/2]

```
Point VectSharp.Plots.LogLinCoordinateSystem2D.ToPlotCoordinates (
            IReadOnlyList< double > dataPoint )
```

Definition at line 694 of file CoordinateSystems.cs.

7.96.3.5 ToPlotCoordinates() [2/2]

```
Point VectSharp.Plots.LogLinCoordinateSystem2D.ToPlotCoordinates (
            Point dataPoint )
```

Transforms the specified *dataPoint* into a plot point.

Parameters

dataPoint	The data whose plot coordinates should be determined.

Returns

A Point representing the *dataPoint* in plot space.

Definition at line 704 of file CoordinateSystems.cs.

7.96.4 Property Documentation

7.96.4.1 IsLinear

```
bool VectSharp.Plots.LogLinCoordinateSystem2D.IsLinear  [get]
```

Gets whether the current coordinate system is linear along all directions.

Implements VectSharp.Plots.IContinuousCoordinateSystem.

Definition at line 548 of file CoordinateSystems.cs.

7.96.4.2 MaxX

```
double VectSharp.Plots.LogLinCoordinateSystem2D.MaxX  [get], [set]
```

The maximum X value.

Definition at line 525 of file CoordinateSystems.cs.

7.96.4.3 MaxY

```
double VectSharp.Plots.LogLinCoordinateSystem2D.MaxY  [get], [set]
```

The maximum Y value (in logarithmic scale).

Definition at line 535 of file CoordinateSystems.cs.

7.96.4.4 MinX

```
double VectSharp.Plots.LogLinCoordinateSystem2D.MinX  [get], [set]
```

The minimum X value.

Definition at line 520 of file CoordinateSystems.cs.

7.96.4.5 MinY

```
double VectSharp.Plots.LogLinCoordinateSystem2D.MinY  [get], [set]
```

The minimum Y value (in logarithmic scale).

Definition at line 530 of file CoordinateSystems.cs.

7.96.4.6 Resolution

```
double [] VectSharp.Plots.LogLinCoordinateSystem2D.Resolution  [get], [set]
```

The maximum difference between two points in data space that appear arbitrarily close in plot space, or some approximation.

Implements VectSharp.Plots.IContinuousCoordinateSystem.

Definition at line 566 of file CoordinateSystems.cs.

7.96.4.7 ScaleX

```
double VectSharp.Plots.LogLinCoordinateSystem2D.ScaleX  [get], [set]
```

The X scale.

Definition at line 540 of file CoordinateSystems.cs.

7.96.4.8 ScaleY

```
double VectSharp.Plots.LogLinCoordinateSystem2D.ScaleY  [get], [set]
```

The y scale.

Definition at line 545 of file CoordinateSystems.cs.

The documentation for this class was generated from the following file:

- VectSharp.Plots/CoordinateSystems.cs

7.97 VectSharp.Markdown.Margins Class Reference

Represents the margins of a page.

Public Member Functions

- Margins (double left, double top, double right, double bottom)

  Creates a new Margins instance.

Properties

- double Left `[get]`

  The left margin.
- double Right `[get]`

  The right margin.
- double Top `[get]`

  The top margin.
- double Bottom `[get]`

  The bottom margin.

7.97.1 Detailed Description

Represents the margins of a page.

Definition at line 185 of file MarkdownContext.cs.

7.97.2 Constructor & Destructor Documentation

7.97.2.1 Margins()

```
VectSharp.Markdown.Margins.Margins (
            double left,
            double top,
            double right,
            double bottom )
```

Creates a new Margins instance.

Parameters

left	The left margin.
top	The top margin.
right	The right margin.
bottom	The bottom margin.

Definition at line 214 of file MarkdownContext.cs.

7.97.3 Property Documentation

7.97.3.1 Bottom

```
double VectSharp.Markdown.Margins.Bottom  [get]
```

The bottom margin.

Definition at line 205 of file MarkdownContext.cs.

7.97.3.2 Left

```
double VectSharp.Markdown.Margins.Left  [get]
```

The left margin.

Definition at line 190 of file MarkdownContext.cs.

7.97.3.3 Right

```
double VectSharp.Markdown.Margins.Right  [get]
```

The right margin.

Definition at line 195 of file MarkdownContext.cs.

7.97.3.4 Top

```
double VectSharp.Markdown.Margins.Top  [get]
```

The top margin.

Definition at line 200 of file MarkdownContext.cs.

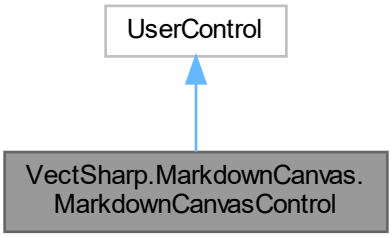
The documentation for this class was generated from the following file:

- VectSharp.Markdown/MarkdownContext.cs

7.98 VectSharp.MarkdownCanvas.MarkdownCanvasControl Class Reference

A control to display a Markdown document in an Avalonia application.

Inheritance diagram for VectSharp.MarkdownCanvas.MarkdownCanvasControl:



Public Member Functions

- MarkdownCanvasControl ()

  Initialises a new MarkdownCanvasControl.

Static Public Attributes

- static readonly StyledProperty< double > MaxRenderWidthProperty = AvaloniaProperty.Register<MarkdownCanvasControl, double>(nameof(MaxRenderWidth), double.PositiveInfinity)

  Defines the MaxRenderWidth property.
- static readonly StyledProperty< double > MinRenderWidthProperty = AvaloniaProperty.Register<MarkdownCanvasControl, double>(nameof(MinRenderWidth), 200)

  Defines the MinRenderWidth property.
- static readonly StyledProperty< double > MinVariationProperty = AvaloniaProperty.Register<MarkdownCanvasControl, double>(nameof(MinVariation), 10)

  Defines the MinVariation property.
- static readonly StyledProperty< string > DocumentSourceProperty = AvaloniaProperty.Register<MarkdownCanvasControl, string>(nameof(DocumentSource))

  Defines the DocumentSource property.
- static readonly StyledProperty< MarkdownDocument > DocumentProperty = AvaloniaProperty.↩ Register<MarkdownCanvasControl, MarkdownDocument>(nameof(Document))

  Defines the Document property.
- static readonly StyledProperty< AvaloniaContextInterpreter.TextOptions > TextConversionOptionsProperty = AvaloniaProperty.Register<MarkdownCanvasControl, AvaloniaContextInterpreter.TextOptions>(nameof(TextConversionOptior AvaloniaContextInterpreter.TextOptions.ConvertIfNecessary)

  Defines the TextConversionOption property.

Properties

- double MaxRenderWidth [get, set]

  The maximum width for the rendered document. This will be used even if the control's client area is larger than this (the alignment of the document within the controll will depend on the control's ContentControl.HorizontalContent↩ Alignment).
- double MinRenderWidth [get, set]

  The minimum width for the rendered document. If the control's client area is smaller than this, the horizontal scroll bar will be activated.
- double MinVariation [get, set]

  The minimum width variation that triggers a document reflow. If the control is resized, but the width changes by less than this amount, the document is not re-drawn.
- string DocumentSource [set]

  Sets the currently displayed document from Markdown source.
- MarkdownDocument Document [get, set]

  Gets or sets the currently displayed MarkdownDocument.
- AvaloniaContextInterpreter.TextOptions TextConversionOption [get, set]

  Gets or sets the value that determines whether text items should be converted into paths when drawing. Setting this to AvaloniaContextInterpreter.TextOptions.NeverConvert will improve performance if you are using custom fonts, but may cause unexpected results unless the font families being used are of type ResourceFontFamily.
- MarkdownRenderer Renderer [get]

  The MarkdownRenderer used to render the Document. You can use the properties of this object to customise the rendering. Note that setting the Avalonia.Controls.Primitives.TemplatedControl.FontSize of the MarkdownCanvasControl will propagate to the Renderer's MarkdownRenderer.BaseFontSize.

7.98.1 Detailed Description

A control to display a Markdown document in an Avalonia application.

Definition at line 36 of file MarkdownCanvas.axaml.cs.

7.98.2 Constructor & Destructor Documentation

7.98.2.1 MarkdownCanvasControl()

```
VectSharp.MarkdownCanvas.MarkdownCanvasControl.MarkdownCanvasControl ( )
```

Initialises a new MarkdownCanvasControl.

Definition at line 134 of file MarkdownCanvas.axaml.cs.

7.98.3 Member Data Documentation

7.98.3.1 DocumentProperty

```
readonly StyledProperty<MarkdownDocument> VectSharp.MarkdownCanvas.MarkdownCanvasControl.↩
DocumentProperty = AvaloniaProperty.Register<MarkdownCanvasControl, MarkdownDocument>(nameof(Document))
[static]
```

Defines the Document property.

Definition at line 96 of file MarkdownCanvas.axaml.cs.

7.98.3.2 DocumentSourceProperty

```
readonly StyledProperty<string> VectSharp.MarkdownCanvas.MarkdownCanvasControl.Document↩
SourceProperty = AvaloniaProperty.Register<MarkdownCanvasControl, string>(nameof(DocumentSource))
[static]
```

Defines the DocumentSource property.

Definition at line 83 of file MarkdownCanvas.axaml.cs.

7.98.3.3 MaxRenderWidthProperty

```
readonly StyledProperty<double> VectSharp.MarkdownCanvas.MarkdownCanvasControl.MaxRender↩
WidthProperty = AvaloniaProperty.Register<MarkdownCanvasControl, double>(nameof(MaxRenderWidth),
double.PositiveInfinity)  [static]
```

Defines the MaxRenderWidth property.

Definition at line 41 of file MarkdownCanvas.axaml.cs.

7.98.3.4 MinRenderWidthProperty

```
readonly StyledProperty<double> VectSharp.MarkdownCanvas.MarkdownCanvasControl.MinRender↩
WidthProperty = AvaloniaProperty.Register<MarkdownCanvasControl, double>(nameof(MinRenderWidth),
200)  [static]
```

Defines the MinRenderWidth property.

Definition at line 55 of file MarkdownCanvas.axaml.cs.

7.98.3.5 MinVariationProperty

```
readonly StyledProperty<double> VectSharp.MarkdownCanvas.MarkdownCanvasControl.MinVariation↩
Property = AvaloniaProperty.Register<MarkdownCanvasControl, double>(nameof(MinVariation), 10)
[static]
```

Defines the MinVariation property.

Definition at line 69 of file MarkdownCanvas.axaml.cs.

7.98.3.6 TextConversionOptionsProperty

```
readonly StyledProperty<AvaloniaContextInterpreter.TextOptions> VectSharp.MarkdownCanvas.↩
MarkdownCanvasControl.TextConversionOptionsProperty = AvaloniaProperty.Register<MarkdownCanvasControl,
AvaloniaContextInterpreter.TextOptions>(nameof(TextConversionOption), AvaloniaContextInterpreter.↩
TextOptions.ConvertIfNecessary)  [static]
```

Defines the TextConversionOption property.

Definition at line 110 of file MarkdownCanvas.axaml.cs.

7.98.4 Property Documentation

7.98.4.1 Document

```
MarkdownDocument VectSharp.MarkdownCanvas.MarkdownCanvasControl.Document  [get], [set]
```

Gets or sets the currently displayed MarkdownDocument.

Definition at line 101 of file MarkdownCanvas.axaml.cs.

7.98.4.2 DocumentSource

```
string VectSharp.MarkdownCanvas.MarkdownCanvasControl.DocumentSource  [set]
```

Sets the currently displayed document from Markdown source.

Definition at line 88 of file MarkdownCanvas.axaml.cs.

7.98.4.3 MaxRenderWidth

```
double VectSharp.MarkdownCanvas.MarkdownCanvasControl.MaxRenderWidth [get], [set]
```

The maximum width for the rendered document. This will be used even if the control's client area is larger than this (the alignment of the document within the controll will depend on the control's ContentControl.HorizontalContent↩ Alignment).

Definition at line 46 of file MarkdownCanvas.axaml.cs.

7.98.4.4 MinRenderWidth

```
double VectSharp.MarkdownCanvas.MarkdownCanvasControl.MinRenderWidth [get], [set]
```

The minimum width for the rendered document. If the control's client area is smaller than this, the horizontal scroll bar will be activated.

Definition at line 60 of file MarkdownCanvas.axaml.cs.

7.98.4.5 MinVariation

```
double VectSharp.MarkdownCanvas.MarkdownCanvasControl.MinVariation [get], [set]
```

The minimum width variation that triggers a document reflow. If the control is resized, but the width changes by less than this amount, the document is not re-drawn.

Definition at line 74 of file MarkdownCanvas.axaml.cs.

7.98.4.6 Renderer

```
MarkdownRenderer VectSharp.MarkdownCanvas.MarkdownCanvasControl.Renderer [get]
```

The MarkdownRenderer used to render the Document. You can use the properties of this object to customise the rendering. Note that setting the Avalonia.Controls.Primitives.TemplatedControl.FontSize of the MarkdownCanvasControl will propagate to the Renderer's MarkdownRenderer.BaseFontSize.

Definition at line 125 of file MarkdownCanvas.axaml.cs.

7.98.4.7 TextConversionOption

```
AvaloniaContextInterpreter.TextOptions VectSharp.MarkdownCanvas.MarkdownCanvasControl.Text↩
ConversionOption [get], [set]
```

Gets or sets the value that determines whether text items should be converted into paths when drawing. Setting this to AvaloniaContextInterpreter.TextOptions.NeverConvert will improve performance if you are using custom fonts, but may cause unexpected results unless the font families being used are of type ResourceFontFamily.

Definition at line 116 of file MarkdownCanvas.axaml.cs.

The documentation for this class was generated from the following file:

- VectSharp.MarkdownCanvas/MarkdownCanvas.axaml.cs

7.99 VectSharp.Markdown.MarkdownRenderer Class Reference

Renders Markdown documents into VectSharp graphics objects.

Public Types

- enum VerticalAlignment

  Defines the options for the vertical alignment of table cells.

Public Member Functions

- Page RenderSinglePage (string markdownSource, double width, out Dictionary< string, string > link↩Destinations)

  Parses the supplied markdownSource using all the supported extensions and renders the resulting document. Page breaks are disabled, and the document is rendered as a single page with the specified width . The page will be cropped at the appropriate height to contain the entire document.
- Page RenderSinglePage (MarkdownDocument markdownDocument, double width, out Dictionary< string, string > linkDestinations)

  Renders the supplied markdownDocument . Page breaks are disabled, and the document is rendered as a single page with the specified width . The page will be cropped at the appropriate height to contain the entire document.
- Document Render (string markdownSource, out Dictionary< string, string > linkDestinations)

  Parses the supplied markdownSource using all the supported extensions and renders the resulting document. The Document produced consists of one or more pages of the size specified in the PageSize of the current instance.
- Document Render (MarkdownDocument mardownDocument, out Dictionary< string, string > link↩Destinations)

  Renders the supplied mardownDocument . The Document produced consists of one or more pages of the size specified in the PageSize of the current instance.

Properties

- double BaseFontSize = 9.71424 `[get, set]`

  The base font size to use when rendering the document. This will be the size of regular elements, and the size of header elements will be expressed as a multiple of this.
- double MathFontScalingFactor = 0.85 `[get, set]`

  Scaling factor for the font size to use when rendering math.
- double[ ] HeaderFontSizeMultipliers `[get]`

  The font size for elements at each header level. The values in this array will be multiplied by the BaseFontSize.
- double[ ] HeaderLineThicknesses = new double[ ] { 1, 1, 0, 0, 0, 0 } `[get]`

  The thickness of the separator line after a header of each level. A value of 0 disables the line after headers of that level.
- double ThematicBreakThickness = 2 `[get, set]`

  The thickness of thematic break lines.
- FontFamily RegularFontFamily = FontFamily.ResolveFontFamily(FontFamily.StandardFontFamilies.Helvetica) `[get, set]`

  The font family for regular text.
- FontFamily BoldFontFamily = FontFamily.ResolveFontFamily(FontFamily.StandardFontFamilies.Helvetica↩Bold) `[get, set]`

  The font family for bold text.
- FontFamily ItalicFontFamily = FontFamily.ResolveFontFamily(FontFamily.StandardFontFamilies.Helvetica↩Oblique) `[get, set]`

  The font family for italic text.
- FontFamily BoldItalicFontFamily = FontFamily.ResolveFontFamily(FontFamily.StandardFontFamilies.↩HelveticaBoldOblique) `[get, set]`

  The font family for bold italic text.
- FontFamily CodeFont = FontFamily.ResolveFontFamily(FontFamily.StandardFontFamilies.Courier) `[get, set]`

  The font family for code elements.
- FontFamily CodeFontBold = FontFamily.ResolveFontFamily(FontFamily.StandardFontFamilies.CourierBold) `[get, set]`

  The font family for bold code elements.
- FontFamily CodeFontItalic = FontFamily.ResolveFontFamily(FontFamily.StandardFontFamilies.Courier↩Oblique) `[get, set]`

  The font family for italic code elements.
- FontFamily CodeFontBoldItalic = FontFamily.ResolveFontFamily(FontFamily.StandardFontFamilies.Courier↩BoldOblique) `[get, set]`

  The font family for bold italic code elements.
- double UnderlineThickness = 0.075 `[get, set]`

  The thickness of underlines. This value will be multiplied by the font size of the element being underlined.
- double BoldUnderlineThickness = 0.15 `[get, set]`

  The thickness of underlines for bold text. This value will be multiplied by the font size of the element being underlined.
- Margins Margins = new Margins(55, 55, 55, 55) `[get, set]`

  The margins of the page.
- Margins TableCellMargins = new Margins(5, 0, 5, 0) `[get, set]`

  The margins for table cells.
- VerticalAlignment TableVAlign = VerticalAlignment.Middle `[get, set]`

  The vertical alignment of table cells.
- Size PageSize = new Size(595, 842) `[get, set]`

  The size of the page.
- double SpaceBeforeParagaph = 0 `[get, set]`

  The space before each text paragraph. This value will be multiplied by the BaseFontSize.

- double SpaceAfterParagraph = 0.75 [get, set]

  The space after each text paragraph. This value will be multiplied by the BaseFontSize.
- double SpaceAfterLine = 0.25 [get, set]

  The space after each line of text. This value will be multiplied by the BaseFontSize.
- double SpaceBeforeHeading = 0.25 [get, set]

  The space before each heading. This value will be multiplied by the font size of the heading.
- double SpaceAfterHeading = 0.25 [get, set]

  The space after each heading. This value will be multiplied by the font size of the heading.
- double CodeInlineMargin = 0.25 [get, set]

  The margin at the left and right of code inlines. This value will be multiplied by the current font size.
- double IndentWidth = 40 [get, set]

  The indentation width used for list items.
- double QuoteBlockIndentWidth = 30 [get, set]

  The indentation width used for block quotes.
- double QuoteBlockBarWidth = 5 [get, set]

  The thickness of the bar to the left of block quotes.
- double SubSuperscriptFontSize = 0.7 [get, set]

  The font size for subscripts and superscripts. This value will be multiplied by the current font size.
- double SuperscriptShift = 0.33 [get, set]

  The upwards shift in the baseline for superscript elements. This value will be multiplied by the current font size.
- double SubscriptShift = 0.14 [get, set]

  The downwards shift in the baseline for subscript elements. This value will be multiplied by the current font size.
- string BaseImageUri = "" [get, set]

  The base uri for resolving relative image addresses.
- Func< string, string,(string, bool)> ImageUriResolver = HTTPUtils.ResolveImageURI [get, set]

  A method used to resolve (possibly remote) image uris into local file paths. The first argument of the method should be the image uri and the second argument the base uri used to resolve relative links. The method should return a tuple containing the path of the local file and a boolean value indicating whether the file has been fetched from a remote location and should be deleted after the program has finished using it.
- Uri BaseLinkUri = new Uri("about:blank") [get, set]

  The base uri for resolving links.
- Func< string, string > LinkUriResolver = a => a [get, set]

  A method used to resolve link addresses. The argument of the method should be the absolute link, and the method should return the resolved address. This can be used to "redirect" links to a different target.
- Func< string, RasterImage > RasterImageLoader = null [get, set]

  A method used to a load raster image from a local file. The argument of the method should be the path of a local image file, and the method should return a RasterImage representing that file. For example, this can be achieved using the `RasterImageFile` class from the `VectSharp.MuPDFUtils` package. If this is `null`, only SVG images will be included in the document.
- double ImageUnitMultiplier = 0.60714 [get, set]

  The size of images (as defined in the image's width and height attributes) will be multiplied by this value to determine the actual size of the image on the page. This has no effect on images without a width or height attribute.
- double ImageMultiplier = 1 [get, set]

  The size of images will be multiplied by this value to determine the actual size of the image on the page. For images that have a width or height attribute, this will be applied in addition to the ImageUnitMultiplier. For images without width and height, only this multiplier will be applied.
- double ImageSideMargin = 10 [get, set]

  The margin on the right of left-aligned images and on the left of right-aligned images.
- double ImageMarginTolerance = 25 [get, set]

  Images will be allowed to extend into the page bottom margin area by this amount before triggering a page break. This should be smaller than the bottom margin, otherwise images risk being cut off by the page boundary.
- Func< string, string, List< List< FormattedString > > > SyntaxHighlighter = VectSharp.Markdown.SyntaxHighlighter.GetSynta
  [get, set]

A method used for syntax highlighting. The first argument should be the source code to highlight, while the second parameter is the name of the language to use for the highlight. The method should return a list of lists of FormattedStrings, with each list of FormattedStrings representing a line. For each code block, if the method returns `null`, no syntax highlighting is used.

- List< Action< Graphics, Colour > > Bullets `[get]`

  Bullet points used for unordered lists. Each element of this list corresponds to the bullet for each level of list indentation. If the list indentation is greater than the number of elements in this list, the bullet points will be reused cyclically. Each element of this list is a method taking two arguments: the first is the Graphics object on which the bullet point should be drawn, while the second is the colour in which it should be painted. The method should draw the bullet point centered around the origin. The size of the bullet point will be multiplied by the current font size.
- Colour ForegroundColour = Colours.Black `[get, set]`

  The foreground colour for text elements.
- Colour BackgroundColour = Colours.White `[get, set]`

  The background colour for the page.
- Colour HeaderLineColour = Colour.FromRgb(180, 180, 180) `[get, set]`

  The colour of the line below headers.
- Colour ThematicBreakLineColour = Colour.FromRgb(180, 180, 200) `[get, set]`

  The colour for thematic break lines.
- Colour LinkColour = Colour.FromRgb(25, 140, 191) `[get, set]`

  The colour for hypertext links-
- Colour CodeInlineBackgroundColour = Colour.FromRgb(240, 240, 240) `[get, set]`

  The background colour for code inlines.
- Colour CodeBlockBackgroundColour = Colour.FromRgb(240, 240, 245) `[get, set]`

  The background colour for code blocks.
- Colour QuoteBlockBarColour = Colour.FromRgb(75, 152, 220) `[get, set]`

  The colour for the bar to the left of block quotes.
- Colour QuoteBlockBackgroundColour = Colour.FromRgb(240, 240, 255) `[get, set]`

  The background colour for block quotes.
- Colour InsertedColour = Colour.FromRgb(0, 158, 115) `[get, set]`

  The colour for text that has been styled as "inserted".
- Colour MarkedColour = Colour.FromRgb(213, 94, 0) `[get, set]`

  The colour for text that has been styled as "marked".
- Colour TableHeaderRowSeparatorColour = Colours.Black `[get, set]`

  The colour for the line separating the table header row from normal rows.
- Colour TableRowSeparatorColour = Colour.FromRgb(180, 180, 180) `[get, set]`

  The colour for lines separating table rows from each other.
- double TableHeaderRowSeparatorThickness = 2 `[get, set]`

  The thickness of the line separating the table header row from normal rows.
- double TableHeaderSeparatorThickness = 1 `[get, set]`

  The thickness of lines separating table rows from each other.
- Graphics TaskListUncheckedBullet `[get, set]`

  The bullet used for unchecked task list items.
- Graphics TaskListCheckedBullet `[get, set]`

  The bullet used for checked task list items.
- bool AllowPageBreak = true `[get, set]`

  Determines whether page breaks should be treated as such in the source.

7.99.1 Detailed Description

Renders Markdown documents into VectSharp graphics objects.

Definition at line 37 of file MarkdownRenderer.cs.

7.99.2 Member Enumeration Documentation

7.99.2.1 VerticalAlignment

```
enum VectSharp.Markdown.MarkdownRenderer.VerticalAlignment
```

Defines the options for the vertical alignment of table cells.

Definition at line 130 of file MarkdownRenderer.cs.

7.99.3 Member Function Documentation

7.99.3.1 Render() [1/2]

```
Document VectSharp.Markdown.MarkdownRenderer.Render (
            MarkdownDocument mardownDocument,
            out Dictionary< string, string > linkDestinations )
```

Renders the supplied *mardownDocument* . The Document produced consists of one or more pages of the size specified in the PageSize of the current instance.

Parameters

mardownDocument	The markdown document to render.
linkDestinations	When this method returns, this value will contain a dictionary used to associate graphic action tags to hyperlinks. This can be used to enable such links when rendering the Document to a file.

Returns

A Document containing a rendering of the supplied markdown document, consisting of one or more pages of the size specified in the PageSize of the current instance.

Definition at line 504 of file MarkdownRenderer.cs.

7.99.3.2 Render() [2/2]

```
Document VectSharp.Markdown.MarkdownRenderer.Render (
            string markdownSource,
            out Dictionary< string, string > linkDestinations )
```

Parses the supplied *markdownSource* using all the supported extensions and renders the resulting document. The Document produced consists of one or more pages of the size specified in the PageSize of the current instance.

Parameters

markdownSource	The markdown source to parse.
linkDestinations	When this method returns, this value will contain a dictionary used to associate graphic action tags to hyperlinks. This can be used to enable such links when rendering the Document to a file.

Returns

A Document containing a rendering of the supplied markdown document, consisting of one or more pages of the size specified in the PageSize of the current instance.

Definition at line 491 of file MarkdownRenderer.cs.

7.99.3.3 RenderSinglePage() [1/2]

```
Page VectSharp.Markdown.MarkdownRenderer.RenderSinglePage (
            MarkdownDocument markdownDocument,
            double width,
            out Dictionary< string, string > linkDestinations )
```

Renders the supplied *markdownDocument* . Page breaks are disabled, and the document is rendered as a single page with the specified *width* . The page will be cropped at the appropriate height to contain the entire document.

Parameters

markdownDocument	The markdown document to render.
width	The width of the page.
linkDestinations	When this method returns, this value will contain a dictionary used to associate graphic action tags to hyperlinks. This can be used to enable such links when rendering the Page to a file.

Returns

A Page containing a rendering of the supplied markdown document.

Definition at line 432 of file MarkdownRenderer.cs.

7.99.3.4 RenderSinglePage() [2/2]

```
Page VectSharp.Markdown.MarkdownRenderer.RenderSinglePage (
            string markdownSource,
            double width,
            out Dictionary< string, string > linkDestinations )
```

Parses the supplied *markdownSource* using all the supported extensions and renders the resulting document. Page breaks are disabled, and the document is rendered as a single page with the specified *width* . The page will be cropped at the appropriate height to contain the entire document.

Parameters

markdownSource	The markdown source to parse.
width	The width of the page.
linkDestinations	When this method returns, this value will contain a dictionary used to associate graphic action tags to hyperlinks. This can be used to enable such links when rendering the Page to a file.

Returns

A Page containing a rendering of the supplied markdown document.

Definition at line 418 of file MarkdownRenderer.cs.

7.99.4 Property Documentation

7.99.4.1 AllowPageBreak

```
bool VectSharp.Markdown.MarkdownRenderer.AllowPageBreak = true  [get], [set]
```

Determines whether page breaks should be treated as such in the source.

Definition at line 402 of file MarkdownRenderer.cs.

7.99.4.2 BackgroundColour

```
Colour VectSharp.Markdown.MarkdownRenderer.BackgroundColour = Colours.White  [get], [set]
```

The background colour for the page.

Definition at line 298 of file MarkdownRenderer.cs.

7.99.4.3 BaseFontSize

```
double VectSharp.Markdown.MarkdownRenderer.BaseFontSize = 9.71424  [get], [set]
```

The base font size to use when rendering the document. This will be the size of regular elements, and the size of header elements will be expressed as a multiple of this.

Definition at line 42 of file MarkdownRenderer.cs.

7.99.4.4 BaseImageUri

```
string VectSharp.Markdown.MarkdownRenderer.BaseImageUri = ""  [get], [set]
```

The base uri for resolving relative image addresses.

Definition at line 221 of file MarkdownRenderer.cs.

7.99.4.5 BaseLinkUri

```
Uri VectSharp.Markdown.MarkdownRenderer.BaseLinkUri = new Uri("about:blank")  [get], [set]
```

The base uri for resolving links.

Definition at line 231 of file MarkdownRenderer.cs.

7.99.4.6 BoldFontFamily

```
FontFamily VectSharp.Markdown.MarkdownRenderer.BoldFontFamily = FontFamily.ResolveFontFamily(Font↩
Family.StandardFontFamilies.HelveticaBold)  [get], [set]
```

The font family for bold text.

Definition at line 75 of file MarkdownRenderer.cs.

7.99.4.7 BoldItalicFontFamily

```
FontFamily VectSharp.Markdown.MarkdownRenderer.BoldItalicFontFamily = FontFamily.ResolveFontFamily(Font↩
Family.StandardFontFamilies.HelveticaBoldOblique)  [get], [set]
```

The font family for bold italic text.

Definition at line 85 of file MarkdownRenderer.cs.

7.99.4.8 BoldUnderlineThickness

```
double VectSharp.Markdown.MarkdownRenderer.BoldUnderlineThickness = 0.15  [get], [set]
```

The thickness of underlines for bold text. This value will be multiplied by the font size of the element being underlined.

Definition at line 115 of file MarkdownRenderer.cs.

7.99.4.9 Bullets

```
List<Action<Graphics, Colour> > VectSharp.Markdown.MarkdownRenderer.Bullets  [get]
```

Initial value:

```
= new List<Action<Graphics, Colour»()
        {
            (graphics, colour) =>
            {
                graphics.FillPath(new GraphicsPath().Arc(-0.5, 0, 0.25, 0, 2 * Math.PI), colour);
            },
            (graphics, colour) =>
            {
                graphics.StrokePath(new GraphicsPath().Arc(-0.5, 0, 0.25, 0, 2 * Math.PI), colour, 0.1);
            },
            (graphics, colour) =>
            {
                graphics.StrokeRectangle(-0.75, -0.25, 0.5, 0.5, colour, 0.1);
            },
        }
```

Bullet points used for unordered lists. Each element of this list corresponds to the bullet for each level of list indentation. If the list indentation is greater than the number of elements in this list, the bullet points will be reused cyclically. Each element of this list is a method taking two arguments: the first is the Graphics object on which the bullet point should be drawn, while the second is the colour in which it should be painted. The method should draw the bullet point centered around the origin. The size of the bullet point will be multiplied by the current font size.

Definition at line 272 of file MarkdownRenderer.cs.

7.99.4.10 CodeBlockBackgroundColour

```
Colour VectSharp.Markdown.MarkdownRenderer.CodeBlockBackgroundColour = Colour.FromRgb(240,
240, 245)  [get], [set]
```

The background colour for code blocks.

Definition at line 323 of file MarkdownRenderer.cs.

7.99.4.11 CodeFont

```
FontFamily VectSharp.Markdown.MarkdownRenderer.CodeFont = FontFamily.ResolveFontFamily(Font↩
Family.StandardFontFamilies.Courier)  [get], [set]
```

The font family for code elements.

Definition at line 90 of file MarkdownRenderer.cs.

7.99.4.12 CodeFontBold

```
FontFamily VectSharp.Markdown.MarkdownRenderer.CodeFontBold = FontFamily.ResolveFontFamily(Font↩
Family.StandardFontFamilies.CourierBold)  [get], [set]
```

The font family for bold code elements.

Definition at line 95 of file MarkdownRenderer.cs.

7.99.4.13 CodeFontBoldItalic

```
FontFamily VectSharp.Markdown.MarkdownRenderer.CodeFontBoldItalic = FontFamily.ResolveFontFamily(Font↩
Family.StandardFontFamilies.CourierBoldOblique)  [get], [set]
```

The font family for bold italic code elements.

Definition at line 105 of file MarkdownRenderer.cs.

7.99.4.14 CodeFontItalic

```
FontFamily VectSharp.Markdown.MarkdownRenderer.CodeFontItalic = FontFamily.ResolveFontFamily(Font↩
Family.StandardFontFamilies.CourierOblique)  [get], [set]
```

The font family for italic code elements.

Definition at line 100 of file MarkdownRenderer.cs.

7.99.4.15 CodeInlineBackgroundColour

```
Colour VectSharp.Markdown.MarkdownRenderer.CodeInlineBackgroundColour = Colour.FromRgb(240,
240, 240)  [get], [set]
```

The background colour for code inlines.

Definition at line 318 of file MarkdownRenderer.cs.

7.99.4.16 CodeInlineMargin

```
double VectSharp.Markdown.MarkdownRenderer.CodeInlineMargin = 0.25  [get], [set]
```

The margin at the left and right of code inlines. This value will be multiplied by the current font size.

Definition at line 186 of file MarkdownRenderer.cs.

7.99.4.17 ForegroundColour

```
Colour VectSharp.Markdown.MarkdownRenderer.ForegroundColour = Colours.Black  [get], [set]
```

The foreground colour for text elements.

Definition at line 293 of file MarkdownRenderer.cs.

7.99.4.18 HeaderFontSizeMultipliers

```
double [] VectSharp.Markdown.MarkdownRenderer.HeaderFontSizeMultipliers  [get]
```

Initial value:

```
= new double[]
        {
            28 / 12.0, 22 / 12.0, 16 / 12.0, 14 / 12.0, 13 / 12.0, 12 / 12.0
        }
```

The font size for elements at each header level. The values in this array will be multiplied by the BaseFontSize.

Definition at line 52 of file MarkdownRenderer.cs.

7.99.4.19 HeaderLineColour

```
Colour VectSharp.Markdown.MarkdownRenderer.HeaderLineColour = Colour.FromRgb(180, 180, 180)
[get], [set]
```

The colour of the line below headers.

Definition at line 303 of file MarkdownRenderer.cs.

7.99.4.20 HeaderLineThicknesses

```
double [] VectSharp.Markdown.MarkdownRenderer.HeaderLineThicknesses = new double[] { 1, 1, 0,
0, 0, 0 }  [get]
```

The thickness of the separator line after a header of each level. A value of 0 disables the line after headers of that level.

Definition at line 60 of file MarkdownRenderer.cs.

7.99.4.21 ImageMarginTolerance

```
double VectSharp.Markdown.MarkdownRenderer.ImageMarginTolerance = 25  [get], [set]
```

Images will be allowed to extend into the page bottom margin area by this amount before triggering a page break. This should be smaller than the bottom margin, otherwise images risk being cut off by the page boundary.

Definition at line 261 of file MarkdownRenderer.cs.

7.99.4.22 ImageMultiplier

```
double VectSharp.Markdown.MarkdownRenderer.ImageMultiplier = 1  [get], [set]
```

The size of images will be multiplied by this value to determine the actual size of the image on the page. For images that have a width or height attribute, this will be applied in addition to the ImageUnitMultiplier. For images without width and height, only this multiplier will be applied.

Definition at line 251 of file MarkdownRenderer.cs.

7.99.4.23 ImageSideMargin

```
double VectSharp.Markdown.MarkdownRenderer.ImageSideMargin = 10  [get], [set]
```

The margin on the right of left-aligned images and on the left of right-aligned images.

Definition at line 256 of file MarkdownRenderer.cs.

7.99.4.24 ImageUnitMultiplier

```
double VectSharp.Markdown.MarkdownRenderer.ImageUnitMultiplier = 0.60714  [get], [set]
```

The size of images (as defined in the image's width and height attributes) will be multiplied by this value to determine the actual size of the image on the page. This has no effect on images without a width or height attribute.

Definition at line 246 of file MarkdownRenderer.cs.

7.99.4.25 ImageUriResolver

```
Func<string, string, (string, bool)> VectSharp.Markdown.MarkdownRenderer.ImageUriResolver =
HTTPUtils.ResolveImageURI  [get], [set]
```

A method used to resolve (possibly remote) image uris into local file paths. The first argument of the method should be the image uri and the second argument the base uri used to resolve relative links. The method should return a tuple containing the path of the local file and a boolean value indicating whether the file has been fetched from a remote location and should be deleted after the program has finished using it.

Definition at line 226 of file MarkdownRenderer.cs.

7.99.4.26 IndentWidth

```
double VectSharp.Markdown.MarkdownRenderer.IndentWidth = 40  [get], [set]
```

The indentation width used for list items.

Definition at line 191 of file MarkdownRenderer.cs.

7.99.4.27 InsertedColour

```
Colour VectSharp.Markdown.MarkdownRenderer.InsertedColour = Colour.FromRgb(0, 158, 115)  [get],
[set]
```

The colour for text that has been styled as "inserted".

Definition at line 338 of file MarkdownRenderer.cs.

7.99.4.28 ItalicFontFamily

```
FontFamily VectSharp.Markdown.MarkdownRenderer.ItalicFontFamily = FontFamily.ResolveFontFamily(Font↩
Family.StandardFontFamilies.HelveticaOblique)  [get], [set]
```

The font family for italic text.

Definition at line 80 of file MarkdownRenderer.cs.

7.99.4.29 LinkColour

```
Colour VectSharp.Markdown.MarkdownRenderer.LinkColour = Colour.FromRgb(25, 140, 191)  [get],
[set]
```

The colour for hypertext links-

Definition at line 313 of file MarkdownRenderer.cs.

7.99.4.30 LinkUriResolver

```
Func<string, string> VectSharp.Markdown.MarkdownRenderer.LinkUriResolver = a => a  [get],
[set]
```

A method used to resolve link addresses. The argument of the method should be the absolute link, and the method should return the resolved address. This can be used to "redirect" links to a different target.

Definition at line 236 of file MarkdownRenderer.cs.

7.99.4.31 Margins

```
Margins VectSharp.Markdown.MarkdownRenderer.Margins = new Margins(55, 55, 55, 55)  [get], [set]
```

The margins of the page.

Definition at line 120 of file MarkdownRenderer.cs.

7.99.4.32 MarkedColour

```
Colour VectSharp.Markdown.MarkdownRenderer.MarkedColour = Colour.FromRgb(213, 94, 0)  [get],
[set]
```

The colour for text that has been styled as "marked".

Definition at line 343 of file MarkdownRenderer.cs.

7.99.4.33 MathFontScalingFactor

```
double VectSharp.Markdown.MarkdownRenderer.MathFontScalingFactor = 0.85  [get], [set]
```

Scaling factor for the font size to use when rendering math.

Definition at line 47 of file MarkdownRenderer.cs.

7.99.4.34 PageSize

```
Size VectSharp.Markdown.MarkdownRenderer.PageSize = new Size(595, 842)  [get], [set]
```

The size of the page.

Definition at line 156 of file MarkdownRenderer.cs.

7.99.4.35 QuoteBlockBackgroundColour

```
Colour VectSharp.Markdown.MarkdownRenderer.QuoteBlockBackgroundColour = Colour.FromRgb(240,
240, 255)  [get], [set]
```

The background colour for block quotes.

Definition at line 333 of file MarkdownRenderer.cs.

7.99.4.36 QuoteBlockBarColour

```
Colour VectSharp.Markdown.MarkdownRenderer.QuoteBlockBarColour = Colour.FromRgb(75, 152, 220)
[get], [set]
```

The colour for the bar to the left of block quotes.

Definition at line 328 of file MarkdownRenderer.cs.

7.99.4.37 QuoteBlockBarWidth

```
double VectSharp.Markdown.MarkdownRenderer.QuoteBlockBarWidth = 5  [get], [set]
```

The thickness of the bar to the left of block quotes.

Definition at line 201 of file MarkdownRenderer.cs.

7.99.4.38 QuoteBlockIndentWidth

```
double VectSharp.Markdown.MarkdownRenderer.QuoteBlockIndentWidth = 30  [get], [set]
```

The indentation width used for block quotes.

Definition at line 196 of file MarkdownRenderer.cs.

7.99.4.39 RasterImageLoader

```
Func<string, RasterImage> VectSharp.Markdown.MarkdownRenderer.RasterImageLoader = null  [get],
[set]
```

A method used to a load raster image from a local file. The argument of the method should be the path of a local image file, and the method should return a RasterImage representing that file. For example, this can be achieved using the `RasterImageFile` class from the `VectSharp.MuPDFUtils` package. If this is `null`, only SVG images will be included in the document.

Definition at line 241 of file MarkdownRenderer.cs.

7.99.4.40 RegularFontFamily

```
FontFamily VectSharp.Markdown.MarkdownRenderer.RegularFontFamily = FontFamily.ResolveFontFamily(Font↩
Family.StandardFontFamilies.Helvetica)  [get], [set]
```

The font family for regular text.

Definition at line 70 of file MarkdownRenderer.cs.

7.99.4.41 SpaceAfterHeading

```
double VectSharp.Markdown.MarkdownRenderer.SpaceAfterHeading = 0.25 [get], [set]
```

The space after each heading. This value will be multiplied by the font size of the heading.

Definition at line 181 of file MarkdownRenderer.cs.

7.99.4.42 SpaceAfterLine

```
double VectSharp.Markdown.MarkdownRenderer.SpaceAfterLine = 0.25 [get], [set]
```

The space after each line of text. This value will be multiplied by the BaseFontSize.

Definition at line 171 of file MarkdownRenderer.cs.

7.99.4.43 SpaceAfterParagraph

```
double VectSharp.Markdown.MarkdownRenderer.SpaceAfterParagraph = 0.75 [get], [set]
```

The space after each text paragraph. This value will be multiplied by the BaseFontSize.

Definition at line 166 of file MarkdownRenderer.cs.

7.99.4.44 SpaceBeforeHeading

```
double VectSharp.Markdown.MarkdownRenderer.SpaceBeforeHeading = 0.25 [get], [set]
```

The space before each heading. This value will be multiplied by the font size of the heading.

Definition at line 176 of file MarkdownRenderer.cs.

7.99.4.45 SpaceBeforeParagaph

```
double VectSharp.Markdown.MarkdownRenderer.SpaceBeforeParagaph = 0 [get], [set]
```

The space before each text paragraph. This value will be multiplied by the BaseFontSize.

Definition at line 161 of file MarkdownRenderer.cs.

7.99.4.46 SubscriptShift

```
double VectSharp.Markdown.MarkdownRenderer.SubscriptShift = 0.14  [get], [set]
```

The downwards shift in the baseline for subscript elements. This value will be multiplied by the current font size.

Definition at line 216 of file MarkdownRenderer.cs.

7.99.4.47 SubSuperscriptFontSize

```
double VectSharp.Markdown.MarkdownRenderer.SubSuperscriptFontSize = 0.7  [get], [set]
```

The font size for subscripts and superscripts. This value will be multiplied by the current font size.

Definition at line 206 of file MarkdownRenderer.cs.

7.99.4.48 SuperscriptShift

```
double VectSharp.Markdown.MarkdownRenderer.SuperscriptShift = 0.33  [get], [set]
```

The upwards shift in the baseline for superscript elements. This value will be multiplied by the current font size.

Definition at line 211 of file MarkdownRenderer.cs.

7.99.4.49 SyntaxHighlighter

```
Func<string, string, List<List<FormattedString> > > VectSharp.Markdown.MarkdownRenderer.↩
SyntaxHighlighter = VectSharp.Markdown.SyntaxHighlighter.GetSyntaxHighlightedLines  [get],
[set]
```

A method used for syntax highlighting. The first argument should be the source code to highlight, while the second parameter is the name of the language to use for the highlight. The method should return a list of lists of FormattedStrings, with each list of FormattedStrings representing a line. For each code block, if the method returns `null`, no syntax highlighting is used.

Definition at line 266 of file MarkdownRenderer.cs.

7.99.4.50 TableCellMargins

```
Margins VectSharp.Markdown.MarkdownRenderer.TableCellMargins = new Margins(5, 0, 5, 0)  [get],
[set]
```

The margins for table cells.

Definition at line 125 of file MarkdownRenderer.cs.

7.99.4.51 TableHeaderRowSeparatorColour

```
Colour VectSharp.Markdown.MarkdownRenderer.TableHeaderRowSeparatorColour = Colours.Black  [get], [set]
```

The colour for the line separating the table header row from normal rows.

Definition at line 348 of file MarkdownRenderer.cs.

7.99.4.52 TableHeaderRowSeparatorThickness

```
double VectSharp.Markdown.MarkdownRenderer.TableHeaderRowSeparatorThickness = 2  [get], [set]
```

The thickness of the line separating the table header row from normal rows.

Definition at line 358 of file MarkdownRenderer.cs.

7.99.4.53 TableHeaderSeparatorThickness

```
double VectSharp.Markdown.MarkdownRenderer.TableHeaderSeparatorThickness = 1  [get], [set]
```

The thickness of lines separating table rows from each other.

Definition at line 363 of file MarkdownRenderer.cs.

7.99.4.54 TableRowSeparatorColour

```
Colour VectSharp.Markdown.MarkdownRenderer.TableRowSeparatorColour = Colour.FromRgb(180, 180, 180)  [get], [set]
```

The colour for lines separating table rows from each other.

Definition at line 353 of file MarkdownRenderer.cs.

7.99.4.55 TableVAlign

```
VerticalAlignment VectSharp.Markdown.MarkdownRenderer.TableVAlign = VerticalAlignment.Middle  [get], [set]
```

The vertical alignment of table cells.

Definition at line 151 of file MarkdownRenderer.cs.

7.99.4.56 TaskListCheckedBullet

```
Graphics VectSharp.Markdown.MarkdownRenderer.TaskListCheckedBullet  [get], [set]
```

Initial value:

```
= new Func<Graphics>(() =>
        {
            Graphics tbr = new Graphics();
            GraphicsPath checkboxPath = new GraphicsPath().MoveTo(-0.7, -0.4).LineTo(-0.3, -0.4).Arc(-0.3,
      -0.2, 0.2, 3 * Math.PI / 2, 2 * Math.PI).LineTo(-0.1, 0.2).Arc(-0.3, 0.2, 0.2, 0, Math.PI /
      2).LineTo(-0.7, 0.4).Arc(-0.7, 0.2, 0.2, Math.PI / 2, Math.PI).LineTo(-0.9, -0.2).Arc(-0.7, -0.2, 0.2,
      Math.PI, 3 * Math.PI / 2).Close();
            tbr.FillPath(checkboxPath, Colour.FromRgb(240, 246, 249));
            tbr.StrokePath(checkboxPath, Colour.FromRgb(0, 114, 178), 0.075);
            GraphicsPath tickpath = new GraphicsPath().MoveTo(-0.75, -0.1).LineTo(-0.5, 0.15).LineTo(-0.1,
      -0.4);
            tbr.StrokePath(new GraphicsPath().MoveTo(-0.5, 0.15).LineTo(-0.1, -0.4), Colour.FromRgb(240,
      246, 249), 0.3, LineCaps.Round);
            tbr.StrokePath(tickpath, Colour.FromRgb(0, 158, 115), 0.2, LineCaps.Round);
            return tbr;
        })()
```

The bullet used for checked task list items.

Definition at line 383 of file MarkdownRenderer.cs.

7.99.4.57 TaskListUncheckedBullet

```
Graphics VectSharp.Markdown.MarkdownRenderer.TaskListUncheckedBullet  [get], [set]
```

Initial value:

```
= new Func<Graphics>(() =>
        {
            Graphics tbr = new Graphics();
            GraphicsPath checkboxPath = new GraphicsPath().MoveTo(-0.7, -0.4).LineTo(-0.3, -0.4).Arc(-0.3,
      -0.2, 0.2, 3 * Math.PI / 2, 2 * Math.PI).LineTo(-0.1, 0.2).Arc(-0.3, 0.2, 0.2, 0, Math.PI /
      2).LineTo(-0.7, 0.4).Arc(-0.7, 0.2, 0.2, Math.PI / 2, Math.PI).LineTo(-0.9, -0.2).Arc(-0.7, -0.2, 0.2,
      Math.PI, 3 * Math.PI / 2).Close();
            tbr.FillPath(checkboxPath, Colour.FromRgb(240, 246, 249));
            tbr.StrokePath(checkboxPath, Colour.FromRgb(0, 114, 178), 0.075);
            return tbr;
        })()
```

The bullet used for unchecked task list items.

Definition at line 368 of file MarkdownRenderer.cs.

7.99.4.58 ThematicBreakLineColour

```
Colour VectSharp.Markdown.MarkdownRenderer.ThematicBreakLineColour = Colour.FromRgb(180, 180,
200)  [get], [set]
```

The colour for thematic break lines.

Definition at line 308 of file MarkdownRenderer.cs.

7.99.4.59 ThematicBreakThickness

```
double VectSharp.Markdown.MarkdownRenderer.ThematicBreakThickness = 2  [get], [set]
```

The thickness of thematic break lines.

Definition at line 65 of file MarkdownRenderer.cs.

7.99.4.60 UnderlineThickness

```
double VectSharp.Markdown.MarkdownRenderer.UnderlineThickness = 0.075  [get], [set]
```

The thickness of underlines. This value will be multiplied by the font size of the element being underlined.

Definition at line 110 of file MarkdownRenderer.cs.

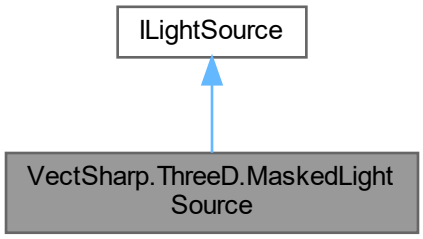
The documentation for this class was generated from the following file:

- VectSharp.Markdown/MarkdownRenderer.cs

7.100 VectSharp.ThreeD.MaskedLightSource Class Reference

Represents a point light source with a stencil in front of it.

Inheritance diagram for VectSharp.ThreeD.MaskedLightSource:



Public Member Functions

- MaskedLightSource (double intensity, Point3D position, NormalizedVector3D direction, double distance, GraphicsPath mask, double maskOrientation, double triangulationResolution)

  Creates a new MaskedLightSource by triangulating the specified GraphicsPath.
- MaskedLightSource (double intensity, Point3D position, NormalizedVector3D direction, double distance, IEnumerable< GraphicsPath > triangulatedMask, double maskOrientation)

  Creates a new MaskedLightSource using the specified triangulatedMask .
- LightIntensity GetLightAt (Point3D point)

  Computes the light intensity at the specified point, without taking into account any obstructions.

Parameters

point	*The Point3DElement at which the light intensity should be computed.*

Returns

- double GetObstruction (Point3D point, IEnumerable< Triangle3DElement > shadowingTriangles)

  Determines the amount of obstruction of the light that results at point due to the specified shadowingTriangles .

Parameters

point	*The Point3D at which the obstruction should be computed.*
shadowingTriangles	*A collection of Triangle3DElement casting shadows.*

Returns

1 if the light is completely obstructed, 0 if the light is completely visible, a value between these if the light is partially obstructed.

Properties

- bool CastsShadow = true `[get, set]`

  Determines whether the light casts a shadow or not.
- Point3D Position `[get]`

  The position of the light source.
- Point3D Origin `[get]`

  The projection of the Position on the mask plane along the light's Direction.
- NormalizedVector3D Direction `[get]`

  The direction of the light.
- double Distance `[get]`

  The distance between the light source and the mask plane.
- double Intensity `[get, set]`

  The base intensity of the light.
- double DistanceAttenuationExponent = 2 `[get, set]`

  An exponent determining how fast the light attenuates with increasing distance. Set to 0 to disable distance attenuation.
- double AngleAttenuationExponent = 1 `[get, set]`

  An exponent determining how fast the light attenuates away from the light's axis. Set to 0 to disable angular attenuation.

7.100.1 Detailed Description

Represents a point light source with a stencil in front of it.

Definition at line 385 of file Lights.cs.

7.100.2 Constructor & Destructor Documentation

7.100.2.1 MaskedLightSource() [1/2]

```
VectSharp.ThreeD.MaskedLightSource.MaskedLightSource (
            double intensity,
            Point3D position,
            NormalizedVector3D direction,
            double distance,
            GraphicsPath mask,
            double maskOrientation,
            double triangulationResolution )
```

Creates a new MaskedLightSource by triangulating the specified GraphicsPath.

Parameters

intensity	The base intensity of the light.
position	The position of the light source.
direction	The direction of the light.
distance	The distance between the light source and the mask plane.
mask	A GraphicsPath representing the transparent part of the mask.
maskOrientation	An angle in radians determining the orientation of the 2D mask in the mask plane.
triangulationResolution	The resolution to use to triangulate the *mask* .

Definition at line 437 of file Lights.cs.

7.100.2.2 MaskedLightSource() [2/2]

```
VectSharp.ThreeD.MaskedLightSource.MaskedLightSource (
            double intensity,
            Point3D position,
            NormalizedVector3D direction,
            double distance,
            IEnumerable< GraphicsPath > triangulatedMask,
            double maskOrientation )
```

Creates a new MaskedLightSource using the specified *triangulatedMask* .

Parameters

intensity	The base intensity of the light.
position	The position of the light source.
direction	The direction of the light.
distance	The distance between the light source and the mask plane.
triangulatedMask	A collection of GraphicsPaths representing the transparent part of the mask. Each GraphicsPath should represent a single triangle.
maskOrientation	An angle in radians determining the orientation of the 2D mask in the mask plane.

Definition at line 451 of file Lights.cs.

7.100.3 Member Function Documentation

7.100.3.1 GetLightAt()

```
LightIntensity VectSharp.ThreeD.MaskedLightSource.GetLightAt (
            Point3D point )
```

Computes the light intensity at the specified point, without taking into account any obstructions.

Parameters

point	The Point3DElement at which the light intensity should be computed.

Returns

Implements VectSharp.ThreeD.ILightSource.

Definition at line 483 of file Lights.cs.

7.100.3.2 GetObstruction()

```
double VectSharp.ThreeD.MaskedLightSource.GetObstruction (
            Point3D point,
            IEnumerable< Triangle3DElement > shadowingTriangles )
```

Determines the amount of obstruction of the light that results at *point* due to the specified *shadowingTriangles* .

Parameters

point	The Point3D at which the obstruction should be computed.
shadowingTriangles	A collection of Triangle3DElement casting shadows.

Returns

1 if the light is completely obstructed, 0 if the light is completely visible, a value between these if the light is partially obstructed.

Implements VectSharp.ThreeD.ILightSource.

Definition at line 556 of file Lights.cs.

7.100.4 Property Documentation

7.100.4.1 AngleAttenuationExponent

```
double VectSharp.ThreeD.MaskedLightSource.AngleAttenuationExponent = 1  [get], [set]
```

An exponent determining how fast the light attenuates away from the light's axis. Set to 0 to disable angular attenuation.

Definition at line 425 of file Lights.cs.

7.100.4.2 CastsShadow

```
bool VectSharp.ThreeD.MaskedLightSource.CastsShadow = true  [get], [set]
```

Determines whether the light casts a shadow or not.

Implements VectSharp.ThreeD.ILightSource.

Definition at line 388 of file Lights.cs.

7.100.4.3 Direction

```
NormalizedVector3D VectSharp.ThreeD.MaskedLightSource.Direction  [get]
```

The direction of the light.

Definition at line 403 of file Lights.cs.

7.100.4.4 Distance

```
double VectSharp.ThreeD.MaskedLightSource.Distance  [get]
```

The distance between the light source and the mask plane.

Definition at line 408 of file Lights.cs.

7.100.4.5 DistanceAttenuationExponent

```
double VectSharp.ThreeD.MaskedLightSource.DistanceAttenuationExponent = 2  [get], [set]
```

An exponent determining how fast the light attenuates with increasing distance. Set to 0 to disable distance attenuation.

Definition at line 420 of file Lights.cs.

7.100.4.6 Intensity

```
double VectSharp.ThreeD.MaskedLightSource.Intensity  [get], [set]
```

The base intensity of the light.

Definition at line 415 of file Lights.cs.

7.100.4.7 Origin

```
Point3D VectSharp.ThreeD.MaskedLightSource.Origin  [get]
```

The projection of the Position on the mask plane along the light's Direction.

Definition at line 398 of file Lights.cs.

7.100.4.8 Position

```
Point3D VectSharp.ThreeD.MaskedLightSource.Position  [get]
```

The position of the light source.

Definition at line 393 of file Lights.cs.

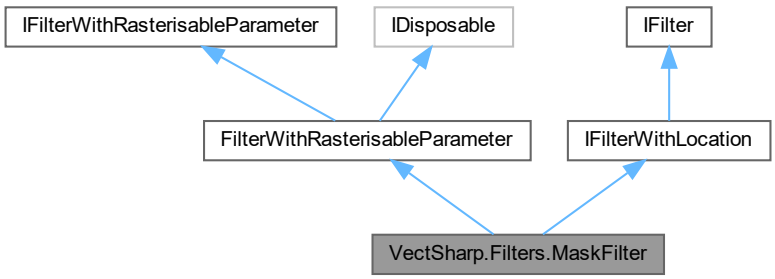
The documentation for this class was generated from the following file:

- VectSharp.ThreeD/Lights.cs

7.101 VectSharp.Filters.MaskFilter Class Reference

Represents a filter that uses the luminance of an image to mask another image.

Inheritance diagram for VectSharp.Filters.MaskFilter:



Public Member Functions

- MaskFilter (Graphics mask)

  Creates a new MaskFilter with the specified mask image.
- RasterImage Filter (RasterImage image, Rectangle bounds, double scale)

  Applies the filter to a RasterImage.

Parameters

image	*The RasterImage to which the filter will be applied.*
bounds	*The region on the graphics surface where the image will be drawn.*
scale	*The scale of the image with respect to the filter.*

Returns

A new RasterImage containing the filtered image. The source image is left unaltered.

Properties

- Point TopLeftMargin `[get]`

  Determines how much the area of the filter's subject should be expanded on the top-left to accommodate the results of the filter.
- Point BottomRightMargin `[get]`

  Determines how much the area of the filter's subject should be expanded on the bottom-right to accommodate the results of the filter.
- Graphics Mask `[get]`

  The image that is used to mask the input image.

7.101.1 Detailed Description

Represents a filter that uses the luminance of an image to mask another image.

Definition at line 26 of file MaskFilter.cs.

7.101.2 Constructor & Destructor Documentation

7.101.2.1 MaskFilter()

```
VectSharp.Filters.MaskFilter.MaskFilter (
            Graphics mask )
```

Creates a new MaskFilter with the specified mask image.

Parameters

mask	The image that is used to mask the input image.

Definition at line 42 of file MaskFilter.cs.

7.101.3 Member Function Documentation

7.101.3.1 Filter()

```
RasterImage VectSharp.Filters.MaskFilter.Filter (
            RasterImage image,
            Rectangle bounds,
            double scale )
```

Applies the filter to a RasterImage.

Parameters

image	The RasterImage to which the filter will be applied.
bounds	The region on the graphics surface where the image will be drawn.
scale	The scale of the image with respect to the filter.

Returns

A new RasterImage containing the filtered image. The source *image* is left unaltered.

Implements VectSharp.Filters.IFilterWithLocation.

Definition at line 45 of file MaskFilter.cs.

7.101.4 Property Documentation

7.101.4.1 BottomRightMargin

```
Point VectSharp.Filters.MaskFilter.BottomRightMargin  [get]
```

Determines how much the area of the filter's subject should be expanded on the bottom-right to accommodate the results of the filter.

Implements VectSharp.Filters.IFilter.

Definition at line 31 of file MaskFilter.cs.

7.101.4.2 Mask

```
Graphics VectSharp.Filters.MaskFilter.Mask  [get]
```

The image that is used to mask the input image.

Definition at line 36 of file MaskFilter.cs.

7.101.4.3 TopLeftMargin

```
Point VectSharp.Filters.MaskFilter.TopLeftMargin [get]
```

Determines how much the area of the filter's subject should be expanded on the top-left to accommodate the results of the filter.

Implements VectSharp.Filters.IFilter.

Definition at line 29 of file MaskFilter.cs.

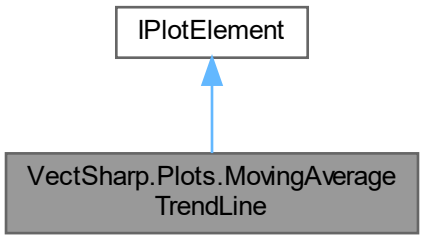
The documentation for this class was generated from the following file:

- VectSharp/Filters/MaskFilter.cs

7.102 VectSharp.Plots.MovingAverageTrendLine Class Reference

A plot element that draws a moving average trendline.

Inheritance diagram for VectSharp.Plots.MovingAverageTrendLine:



Public Member Functions

- MovingAverageTrendLine (IReadOnlyList< IReadOnlyList< double > > data, int period, ICoordinateSystem< IReadOnlyList< double > > coordinateSystem)

  Create a new MovingAverageTrendLine instance from the specified data.
- MovingAverageTrendLine (IReadOnlyList<(double, double)> data, int period, IContinuousCoordinateSystem coordinateSystem)

  Create a new MovingAverageTrendLine instance from the specified data.
- void Plot (Graphics target)

  Draw the plot element on the specified target Graphics.

Parameters

target	*The Graphics on which to draw.*

Properties

- IReadOnlyList< IReadOnlyList< double > > Data `[get, set]`

  The data used to compute the moving average. These must be sorted in a sensible way.
- Func< int, double[], double > Weight = (int i, double[] d) => 1 `[get, set]`

  The weight function. This should accept two parameters: an `int` representing the difference in index between the point being weighted and the "focus point", and a `double[]` representing the difference in coordinates between the two points. It should return a `double` representing the weight (it does not need to be normalised).
- int Period `[get, set]`

  The number of points that are averaged to obtain the value for each point. This must be ≥ 0.
- PlotElementPresentationAttributes PresentationAttributes = new PlotElementPresentationAttributes() { LineDash = new LineDash(5, 5, 0), Stroke = Colour.FromRgb(180, 180, 180) } `[get, set]`

  Presentation attributes for the trendline.
- string Tag `[get, set]`

  A tag to identify the trendline in the plot.
- ICoordinateSystem< IReadOnlyList< double > > CoordinateSystem `[get, set]`

  The coordinate system used to transform the points from data space to plot space.

7.102.1 Detailed Description

A plot element that draws a moving average trendline.

Definition at line 1074 of file Trendlines.cs.

7.102.2 Constructor & Destructor Documentation

7.102.2.1 MovingAverageTrendLine() [1/2]

```
VectSharp.Plots.MovingAverageTrendLine.MovingAverageTrendLine (
            IReadOnlyList< IReadOnlyList< double > > data,
            int period,
            ICoordinateSystem< IReadOnlyList< double > > coordinateSystem )
```

Create a new MovingAverageTrendLine instance from the specified data.

Parameters

data	The data used to compute the moving average. These must be sorted in a sensible way.
period	The number of points that are averaged to obtain the value for each point. This must be ≥ 0.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Exceptions

ArgumentOutOfRangeException	Thrown if the *period* is < 0.

Definition at line 1117 of file Trendlines.cs.

7.102.2.2 MovingAverageTrendLine() [2/2]

```
VectSharp.Plots.MovingAverageTrendLine.MovingAverageTrendLine (
            IReadOnlyList<(double, double)> data,
            int period,
            IContinuousCoordinateSystem coordinateSystem )
```

Create a new MovingAverageTrendLine instance from the specified data.

Parameters

data	The data used to compute the moving average. These must be sorted in a sensible way.
period	The number of points that are averaged to obtain the value for each point. This must be ≥ 0.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Exceptions

ArgumentOutOfRangeException	Thrown if the *period* is < 0.

Definition at line 1136 of file Trendlines.cs.

7.102.3 Member Function Documentation

7.102.3.1 Plot()

```
void VectSharp.Plots.MovingAverageTrendLine.Plot (
            Graphics target )
```

Draw the plot element on the specified *target* Graphics.

Parameters

target	The Graphics on which to draw.

Implements VectSharp.Plots.IPlotElement.

Definition at line 1139 of file Trendlines.cs.

7.102.4 Property Documentation

7.102.4.1 CoordinateSystem

```
ICoordinateSystem<IReadOnlyList<double> > VectSharp.Plots.MovingAverageTrendLine.Coordinate↩
System [get], [set]
```

The coordinate system used to transform the points from data space to plot space.

Implements VectSharp.Plots.IPlotElement.

Definition at line 1107 of file Trendlines.cs.

7.102.4.2 Data

```
IReadOnlyList<IReadOnlyList<double> > VectSharp.Plots.MovingAverageTrendLine.Data [get],
[set]
```

The data used to compute the moving average. These must be sorted in a sensible way.

Definition at line 1079 of file Trendlines.cs.

7.102.4.3 Period

```
int VectSharp.Plots.MovingAverageTrendLine.Period [get], [set]
```

The number of points that are averaged to obtain the value for each point. This must be ≥ 0.

Definition at line 1092 of file Trendlines.cs.

7.102.4.4 PresentationAttributes

```
PlotElementPresentationAttributes VectSharp.Plots.MovingAverageTrendLine.PresentationAttributes
= new PlotElementPresentationAttributes() { LineDash = new LineDash(5, 5, 0), Stroke = Colour.FromRgb(180,
180, 180) } [get], [set]
```

Presentation attributes for the trendline.

Definition at line 1097 of file Trendlines.cs.

7.102.4.5 Tag

```
string VectSharp.Plots.MovingAverageTrendLine.Tag [get], [set]
```

A tag to identify the trendline in the plot.

Definition at line 1102 of file Trendlines.cs.

7.102.4.6 Weight

```
Func<int, double[], double> VectSharp.Plots.MovingAverageTrendLine.Weight = (int i, double[]
d) => 1  [get], [set]
```

The weight function. This should accept two parameters: an `int` representing the difference in index between the point being weighted and the "focus point", and a `double`[] representing the difference in coordinates between the two points. It should return a `double` representing the weight (it does not need to be normalised).

Definition at line 1087 of file Trendlines.cs.

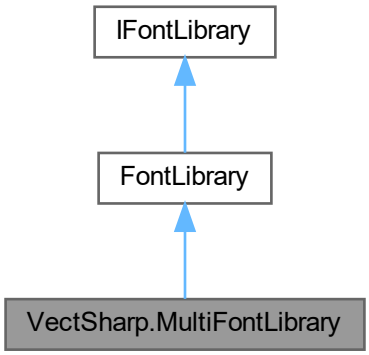
The documentation for this class was generated from the following file:

- VectSharp.Plots/Trendlines.cs

7.103 VectSharp.MultiFontLibrary Class Reference

A font library that tries to resolve fonts using other font libraries.

Inheritance diagram for VectSharp.MultiFontLibrary:



Public Member Functions

- MultiFontLibrary (params FontLibrary[ ] libraries)

  Creates a new MultiFontLibrary resolving fonts using the specified libraries .
- MultiFontLibrary (IEnumerable< FontLibrary > libraries)

  Creates a new MultiFontLibrary resolving fonts using the specified libraries .
- override FontFamily ResolveFontFamily (string fontFamily)

  Create a new font family from the specified family name or true type file. If the family name or the true type file are not valid, an exception might be raised.

Parameters

fontFamily	*The name of the font family to create, or the path to a TTF file.*

Returns

If the font family name or the true type file is valid, a FontFamily object corresponding to the specified font family.

- override FontFamily ResolveFontFamily (FontFamily.StandardFontFamilies standardFontFamily)

  Create a new font family from the specified standard font family name.

Parameters

standardFontFamily	*The standard name of the font family.*

Returns

A FontFamily object corresponding to the specified font family.

7.103.1 Detailed Description

A font library that tries to resolve fonts using other font libraries.

Definition at line 654 of file FontLibrary.cs.

7.103.2 Constructor & Destructor Documentation

7.103.2.1 MultiFontLibrary() [1/2]

```
VectSharp.MultiFontLibrary.MultiFontLibrary (
            params FontLibrary[] libraries )
```

Creates a new MultiFontLibrary resolving fonts using the specified *libraries* .

Parameters

libraries	The font libraries that will be used, in order, to resolve the font families.

Exceptions

ArgumentException	Thrown if the *libraries* do not contain any element.

Definition at line 664 of file FontLibrary.cs.

7.103.2.2 MultiFontLibrary() [2/2]

```
VectSharp.MultiFontLibrary.MultiFontLibrary (
            IEnumerable< FontLibrary > libraries )
```

Creates a new MultiFontLibrary resolving fonts using the specified *libraries* .

Parameters

libraries	The font libraries that will be used, in order, to resolve the font families.

Exceptions

ArgumentException	Thrown if the *libraries* do not contain any element.

Definition at line 672 of file FontLibrary.cs.

7.103.3 Member Function Documentation

7.103.3.1 ResolveFontFamily() [1/2]

```
override FontFamily VectSharp.MultiFontLibrary.ResolveFontFamily (
            FontFamily.StandardFontFamilies standardFontFamily )  [virtual]
```

Create a new font family from the specified standard font family name.

Parameters

standardFontFamily	The standard name of the font family.

Returns

A FontFamily object corresponding to the specified font family.

Implements VectSharp.FontLibrary.

Definition at line 699 of file FontLibrary.cs.

7.103.3.2 ResolveFontFamily() [2/2]

```
override FontFamily VectSharp.MultiFontLibrary.ResolveFontFamily (
            string fontFamily )  [virtual]
```

Create a new font family from the specified family name or true type file. If the family name or the true type file are not valid, an exception might be raised.

Parameters

fontFamily	The name of the font family to create, or the path to a TTF file.

Returns

If the font family name or the true type file is valid, a FontFamily object corresponding to the specified font family.

Implements VectSharp.FontLibrary.

Definition at line 683 of file FontLibrary.cs.

The documentation for this class was generated from the following file:

- VectSharp/FontLibrary.cs

7.104 VectSharp.Fonts.Nimbus Class Reference

Contains an IFontLibrary providing access to the Nimbus family of standard fonts (used e.g. by MuPDF).

Properties

- static IFontLibrary Library `[get]`

  The font library.

7.104.1 Detailed Description

Contains an IFontLibrary providing access to the Nimbus family of standard fonts (used e.g. by MuPDF).

Definition at line 21 of file Nimbus.cs.

7.104.2 Property Documentation

7.104.2.1 Library

```
IFontLibrary VectSharp.Fonts.Nimbus.Library  [static], [get]
```

The font library.

Definition at line 26 of file Nimbus.cs.

The documentation for this class was generated from the following file:

- VectSharp.Fonts.Nimbus/Nimbus.cs

7.105 VectSharp.ThreeD.ObjectFactory Class Reference

A static class containing methods to create complex 3D objects.

Static Public Member Functions

- static List< Element3D > CreateCube (Point3D center, double size, IEnumerable< IMaterial > fill, string tag=null, int zIndex=0)

  Creates a cube.
- static List< Element3D > CreateCuboid (Point3D center, double sizeX, double sizeY, double sizeZ, IEnumerable< IMaterial > fill, string tag=null, int zIndex=0)

  Creates a cuboid.
- static List< Element3D > CreateRectangle (Point3D point1, Point3D point2, Point3D point3, Point3D point4, IEnumerable< IMaterial > fill, string tag=null, int zIndex=0)

  Creates a quadrilater. All the vertices need not be coplanar.
- static List< Element3D > CreateRectangle (Point3D point1, Point3D point2, Point3D point3, Point3D point4, NormalizedVector3D point1Normal, NormalizedVector3D point2Normal, NormalizedVector3D point3Normal, NormalizedVector3D point4Normal, IEnumerable< IMaterial > fill, string tag=null, int zIndex=0)

  Creates a quadrilater, specifying the vertex normals at the four vertices. All the vertices need not be coplanar.
- static List< Element3D > CreateSphere (Point3D center, double radius, int steps, IEnumerable< IMaterial > fill, string tag=null, int zIndex=0)

  Creates a sphere.
- static List< Element3D > CreateTetrahedron (Point3D center, double radius, IEnumerable< IMaterial > fill, string tag=null, int zIndex=0)

  Creates a tetrahedron inscribed in a sphere.
- static List< Element3D > CreatePolygon (GraphicsPath polygon2D, double triangulationResolution, Point3D origin, NormalizedVector3D xAxis, NormalizedVector3D yAxis, bool reverseTriangles, IEnumerable< IMaterial > fill, string tag=null, int zIndex=0)

  Creates a flat polygon.
- static List< Element3D > CreatePrism (GraphicsPath polygonBase2D, double triangulationResolution, Point3D bottomOrigin, Point3D topOrigin, NormalizedVector3D baseXAxis, NormalizedVector3D baseYAxis, IEnumerable< IMaterial > fill, string tag=null, int zIndex=0)

  Creates a prism with the specified base.
- static List< Element3D > CreateWireframe (IEnumerable< Element3D > object3D, Colour colour, double thickness=1, LineCaps lineCap=LineCaps.Butt, LineDash? lineDash=null, string tag=null, int zIndex=0)

  Creates a wireframe from a collection of Element3Ds.
- static List< Element3D > CreatePoints (IEnumerable< Element3D > object3D, Colour colour, double diameter=1, string tag=null, int zIndex=0)

  Obtains a list of Point3DElement corresponding to the vertices of a list of Element3Ds.

7.105.1 Detailed Description

A static class containing methods to create complex 3D objects.

Definition at line 28 of file ObjectFactory.cs.

7.105.2 Member Function Documentation

7.105.2.1 CreateCube()

```
static List< Element3D > VectSharp.ThreeD.ObjectFactory.CreateCube (
            Point3D center,
            double size,
            IEnumerable< IMaterial > fill,
            string tag = null,
            int zIndex = 0 )  [static]
```

Creates a cube.

Parameters

center	The centre of the cube.
size	The length of each side of the cube.
fill	A collection of materials that will be applied to the Triangle3DElements returned by this method.
tag	A tag that will be applied to the Triangle3DElements returned by this method.
zIndex	A z-index that will be applied to the Triangle3DElements returned by this method.

Returns

A list of Triangle3DElements that constitute the cube.

Definition at line 39 of file ObjectFactory.cs.

7.105.2.2 CreateCuboid()

```
static List< Element3D > VectSharp.ThreeD.ObjectFactory.CreateCuboid (
            Point3D center,
            double sizeX,
            double sizeY,
            double sizeZ,
            IEnumerable< IMaterial > fill,
            string tag = null,
            int zIndex = 0 )  [static]
```

Creates a cuboid.

Parameters

center	The centre of the cube.
sizeX	The length of the sides of the cube parallel to the x axis.
sizeY	The length of the sides of the cube parallel to the y axis.
sizeZ	The length of the sides of the cube parallel to the z axis.
fill	A collection of materials that will be applied to the Triangle3DElements returned by this method.
tag	A tag that will be applied to the Triangle3DElements returned by this method.
zIndex	A z-index that will be applied to the Triangle3DElements returned by this method.

Returns

A list of Triangle3DElements that constitute the cuboid.

Definition at line 55 of file ObjectFactory.cs.

7.105.2.3 CreatePoints()

```
static List< Element3D > VectSharp.ThreeD.ObjectFactory.CreatePoints (
            IEnumerable< Element3D > object3D,
            Colour colour,
            double diameter = 1,
            string tag = null,
            int zIndex = 0 )  [static]
```

Obtains a list of Point3DElement corresponding to the vertices of a list of Element3Ds.

Parameters

object3D	The collection of Element3Ds. Point3DElements are ignored.
colour	The colour of the Point3DElements returned by this method.
diameter	The diameter of the Point3DElements returned by this method.
tag	A tag that will be applied to the Point3DElements returned by this method.
zIndex	A z-index that will be applied to the Point3DElements returned by this method.

Returns

A list of Point3DElements corresponding to the vertices of the Element3Ds.

Definition at line 412 of file ObjectFactory.cs.

7.105.2.4 CreatePolygon()

```
static List< Element3D > VectSharp.ThreeD.ObjectFactory.CreatePolygon (
            GraphicsPath polygon2D,
            double triangulationResolution,
            Point3D origin,
            NormalizedVector3D xAxis,
            NormalizedVector3D yAxis,
            bool reverseTriangles,
            IEnumerable< IMaterial > fill,
            string tag = null,
            int zIndex = 0 )  [static]
```

Creates a flat polygon.

Parameters

polygon2D	A 2D GraphicsPath representing the polygon.
triangulationResolution	The resolution that will be used to linearise curve segments in the GraphicsPath.
origin	A Point3D that will correspond to the origin of the 2D reference system.
xAxis	A NormalizedVector3D that will correspond to the x axis of the 2D reference system. This will be orthonormalised to the *yAxis* .
yAxis	A NormalizedVector3D that will correspond to the y axis of the 2D reference system.
reverseTriangles	Indicates whether the order of the points (and thus the normals) of all the triangles returned by this method should be reversed.
fill	A collection of materials that will be applied to the Triangle3DElements returned by this method.
tag	A tag that will be applied to the Triangle3DElements returned by this method.
zIndex	A z-index that will be applied to the Triangle3DElements returned by this method.

Returns

A list of Triangle3DElements that constitute the polygon.

Definition at line 273 of file ObjectFactory.cs.

7.105.2.5 CreatePrism()

```
static List< Element3D > VectSharp.ThreeD.ObjectFactory.CreatePrism (
            GraphicsPath polygonBase2D,
            double triangulationResolution,
            Point3D bottomOrigin,
            Point3D topOrigin,
            NormalizedVector3D baseXAxis,
            NormalizedVector3D baseYAxis,
            IEnumerable< IMaterial > fill,
            string tag = null,
            int zIndex = 0 )  [static]
```

Creates a prism with the specified base.

Parameters

polygonBase2D	A 2D GraphicsPath representing the base of the prism.
triangulationResolution	The resolution that will be used to linearise curve segments in the GraphicsPath.
bottomOrigin	A Point3D that will correspond to the origin of the 2D reference system of the bottom base.
topOrigin	A Point3D that will correspond to the origin of the 2D reference system of the top base.
baseXAxis	A NormalizedVector3D that will correspond to the x axis of the 2D reference system of the bases. This will be orthonormalised to the *baseYAxis* .
baseYAxis	A NormalizedVector3D that will correspond to the y axis of the 2D reference system of the bases.
fill	A collection of materials that will be applied to the Triangle3DElements returned by this method.
tag	A tag that will be applied to the Triangle3DElements returned by this method.
zIndex	A z-index that will be applied to the Triangle3DElements returned by this method.

Returns

A list of Triangle3DElements that constitute the prism.

Definition at line 314 of file ObjectFactory.cs.

7.105.2.6 CreateRectangle() [1/2]

```
static List< Element3D > VectSharp.ThreeD.ObjectFactory.CreateRectangle (
            Point3D point1,
            Point3D point2,
            Point3D point3,
            Point3D point4,
            IEnumerable< IMaterial > fill,
            string tag = null,
            int zIndex = 0 )  [static]
```

Creates a quadrilater. All the vertices need not be coplanar.

Parameters

point1	The first vertex of the quadrilater.
point2	The second vertex of the quadrilater.
point3	The third vertex of the quadrilater.
point4	The fourth vertex of the quadrilater.
fill	A collection of materials that will be applied to the Triangle3DElements returned by this method.
tag	A tag that will be applied to the Triangle3DElements returned by this method.
zIndex	A z-index that will be applied to the Triangle3DElements returned by this method.

Returns

A list containing two Triangle3DElements representing the quadrilater.

Definition at line 93 of file ObjectFactory.cs.

7.105.2.7 CreateRectangle() [2/2]

```
static List< Element3D > VectSharp.ThreeD.ObjectFactory.CreateRectangle (
            Point3D point1,
            Point3D point2,
            Point3D point3,
            Point3D point4,
            NormalizedVector3D point1Normal,
            NormalizedVector3D point2Normal,
            NormalizedVector3D point3Normal,
            NormalizedVector3D point4Normal,
            IEnumerable< IMaterial > fill,
            string tag = null,
            int zIndex = 0 )  [static]
```

Creates a quadrilater, specifying the vertex normals at the four vertices. All the vertices need not be coplanar.

Parameters

point1	The first vertex of the quadrilater.
point2	The second vertex of the quadrilater.
point3	The third vertex of the quadrilater.
point4	The fourth vertex of the quadrilater.
point1Normal	The vertex normal at the first vertex of the quadrilater.
point2Normal	The vertex normal at the second vertex of the quadrilater.
point3Normal	The vertex normal at the third vertex of the quadrilater.
point4Normal	The vertex normal at the fourth vertex of the quadrilater.
fill	A collection of materials that will be applied to the Triangle3DElements returned by this method.
tag	A tag that will be applied to the Triangle3DElements returned by this method.
zIndex	A z-index that will be applied to the Triangle3DElements returned by this method.

Returns

A list containing two Triangle3DElements representing the quadrilater.

Definition at line 123 of file ObjectFactory.cs.

7.105.2.8 CreateSphere()

```
static List< Element3D > VectSharp.ThreeD.ObjectFactory.CreateSphere (
            Point3D center,
            double radius,
            int steps,
            IEnumerable< IMaterial > fill,
            string tag = null,
            int zIndex = 0 )  [static]
```

Creates a sphere.

Parameters

center	The centre of the sphere.
radius	The radius of the sphere.
steps	The number of meridians and parallels to use when generating the sphere.
fill	A collection of materials that will be applied to the Triangle3DElements returned by this method.
tag	A tag that will be applied to the Triangle3DElements returned by this method.
zIndex	A z-index that will be applied to the Triangle3DElements returned by this method.

Returns

A list of Triangle3DElements that constitute the sphere.

Definition at line 148 of file ObjectFactory.cs.

7.105.2.9 CreateTetrahedron()

```
static List< Element3D > VectSharp.ThreeD.ObjectFactory.CreateTetrahedron (
            Point3D center,
            double radius,
            IEnumerable< IMaterial > fill,
            string tag = null,
            int zIndex = 0 )  [static]
```

Creates a tetrahedron inscribed in a sphere.

Parameters

center	The centre of the tetrahedron.
radius	The radius of the sphere in which the tetrahedron is inscribed.
fill	A collection of materials that will be applied to the Triangle3DElements returned by this method.
tag	A tag that will be applied to the Triangle3DElements returned by this method.
zIndex	A z-index that will be applied to the Triangle3DElements returned by this method.

Returns

A list of Triangle3DElements that constitute the sphere.

Definition at line 238 of file ObjectFactory.cs.

7.105.2.10 CreateWireframe()

```
static List< Element3D > VectSharp.ThreeD.ObjectFactory.CreateWireframe (
            IEnumerable< Element3D > object3D,
            Colour colour,
            double thickness = 1,
            LineCaps lineCap = LineCaps.Butt,
            LineDash?  lineDash = null,
            string tag = null,
            int zIndex = 0 )  [static]
```

Creates a wireframe from a collection of Element3Ds.

Parameters

object3D	The collection of Element3Ds. Line3DElements and Point3DElements are ignored.
colour	The colour of the Line3DElements returned by this method.
thickness	The thickness of the Line3DElements returned by this method.
lineCap	The line cap of the Line3DElements returned by this method.
lineDash	The line dash of the Line3DElements returned by this method.
tag	A tag that will be applied to the Line3DElements returned by this method.
zIndex	A z-index that will be applied to the Line3DElements returned by this method.

Returns

A list of Line3DElements that constitute the wireframe.

Definition at line 370 of file ObjectFactory.cs.

The documentation for this class was generated from the following file:

- VectSharp.ThreeD/ObjectFactory.cs

7.106 VectSharp.Page Class Reference

Represents a Graphics object with a width and height.

Public Member Functions

- Page (double width, double height)
  Create a new page.
- void Crop (Rectangle region, bool removeClippedGraphics=false, string tag=null)
  Translate and resize the Page so that it displays the specified region .
- void Crop (Point topLeft, Size size, bool removeClippedGraphics=false, string tag=null)
  Translate and resize the Page so that it displays the rectangle defined by topLeft and size .
- void Crop (string tag=null)
  Translate and resize the Page so that it displays the rectangle corresponding to the bounding box of its contents.

Properties

- double Width `[get, set]`
  Width of the page.
- double Height `[get, set]`
  Height of the page.
- Graphics Graphics `[get, set]`
  Graphics surface of the page.
- Colour Background = Colour.FromRgba(255, 255, 255, 0) `[get, set]`
  Background colour of the page.

7.106.1 Detailed Description

Represents a Graphics object with a width and height.

Definition at line 47 of file Document.cs.

7.106.2 Constructor & Destructor Documentation

7.106.2.1 Page()

```
VectSharp.Page.Page (
            double width,
            double height )
```

Create a new page.

Parameters

width	The width of the page.
height	The height of the page.

Definition at line 74 of file Document.cs.

7.106.3 Member Function Documentation

7.106.3.1 Crop() [1/3]

```
void VectSharp.Page.Crop (
            Point topLeft,
            Size size,
            bool removeClippedGraphics = false,
            string tag = null )
```

Translate and resize the Page so that it displays the rectangle defined by *topLeft* and *size* .

Parameters

topLeft	The top left corner of the area to include in the page.
size	The size of the area to include in the page.
removeClippedGraphics	If this is `true`, graphics actions that fall outside of the specified region are completely removed from the plot, otherwise they are just hidden.
tag	A tag to identify the transform.

Definition at line 101 of file Document.cs.

7.106.3.2 Crop() [2/3]

```
void VectSharp.Page.Crop (
            Rectangle region,
            bool removeClippedGraphics = false,
            string tag = null )
```

Translate and resize the Page so that it displays the specified *region* .

Parameters

region	The area to include in the page.
removeClippedGraphics	If this is `true`, graphics actions that fall outside of the specified region are completely removed from the plot, otherwise they are just hidden.
tag	A tag to identify the transform.

Definition at line 89 of file Document.cs.

7.106.3.3 Crop() [3/3]

```
void VectSharp.Page.Crop (
            string tag = null )
```

Translate and resize the Page so that it displays the rectangle corresponding to the bounding box of its contents.

Parameters

tag	A tag to identify the transform.

Definition at line 129 of file Document.cs.

7.106.4 Property Documentation

7.106.4.1 Background

```
Colour VectSharp.Page.Background = Colour.FromRgba(255, 255, 255, 0)  [get], [set]
```

Background colour of the page.

Definition at line 67 of file Document.cs.

7.106.4.2 Graphics

```
Graphics VectSharp.Page.Graphics  [get], [set]
```

Graphics surface of the page.

Definition at line 62 of file Document.cs.

7.106.4.3 Height

```
double VectSharp.Page.Height  [get], [set]
```

Height of the page.

Definition at line 57 of file Document.cs.

7.106.4.4 Width

```
double VectSharp.Page.Width  [get], [set]
```

Width of the page.

Definition at line 52 of file Document.cs.

The documentation for this class was generated from the following file:

- VectSharp/Document.cs

7.107 VectSharp.TrueTypeFile.PairKerning Class Reference

Contains information describing how the position of two glyphs in a kerning pair should be altered.

Properties

- Point Glyph1Placement [get]

  This vector contains the displacement that should be applied to the first glyph of the pair.
- Point Glyph1Advance [get]

  This vector describes how the advance width of the first glyph should be altered.
- Point Glyph2Placement [get]

  This vector contains the displacement that should be applied to the second glyph of the pair.
- Point Glyph2Advance [get]

  This vector describes how the advance width of the second glyph should be altered.

7.107.1 Detailed Description

Contains information describing how the position of two glyphs in a kerning pair should be altered.

Definition at line 4440 of file TrueType.cs.

7.107.2 Property Documentation

7.107.2.1 Glyph1Advance

```
Point VectSharp.TrueTypeFile.PairKerning.Glyph1Advance  [get]
```

This vector describes how the advance width of the first glyph should be altered.

Definition at line 4450 of file TrueType.cs.

7.107.2.2 Glyph1Placement

```
Point VectSharp.TrueTypeFile.PairKerning.Glyph1Placement [get]
```

This vector contains the displacement that should be applied to the first glyph of the pair.

Definition at line 4445 of file TrueType.cs.

7.107.2.3 Glyph2Advance

```
Point VectSharp.TrueTypeFile.PairKerning.Glyph2Advance [get]
```

This vector describes how the advance width of the second glyph should be altered.

Definition at line 4460 of file TrueType.cs.

7.107.2.4 Glyph2Placement

```
Point VectSharp.TrueTypeFile.PairKerning.Glyph2Placement [get]
```

This vector contains the displacement that should be applied to the second glyph of the pair.

Definition at line 4455 of file TrueType.cs.

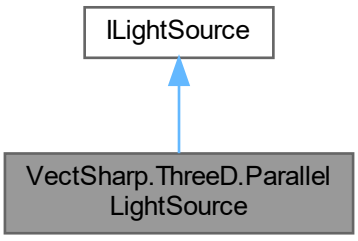
The documentation for this class was generated from the following file:

- VectSharp/TrueType.cs

7.108 VectSharp.ThreeD.ParallelLightSource Class Reference

Represents a parallel light source.

Inheritance diagram for VectSharp.ThreeD.ParallelLightSource:



Public Member Functions

- ParallelLightSource (double intensity, NormalizedVector3D direction)

  Creates a new ParallelLightSource instance.
- LightIntensity GetLightAt (Point3D point)

  Computes the light intensity at the specified point, without taking into account any obstructions.

Parameters

point	*The Point3DElement at which the light intensity should be computed.*

Returns

- double GetObstruction (Point3D point, IEnumerable< Triangle3DElement > shadowingTriangles)

  Determines the amount of obstruction of the light that results at point due to the specified shadowingTriangles .

Parameters

point	*The Point3D at which the obstruction should be computed.*
shadowingTriangles	*A collection of Triangle3DElement casting shadows.*

Returns

1 if the light is completely obstructed, 0 if the light is completely visible, a value between these if the light is partially obstructed.

Properties

- double Intensity `[get, set]`

  The intensity of the light.
- NormalizedVector3D Direction `[get]`

  The direction along which the light travels.
- NormalizedVector3D ReverseDirection `[get]`

  The reverse of Direction.
- bool CastsShadow = true `[get, set]`

  Determines whether the light casts a shadow or not.

7.108.1 Detailed Description

Represents a parallel light source.

Definition at line 126 of file Lights.cs.

7.108.2 Constructor & Destructor Documentation

7.108.2.1 ParallelLightSource()

```
VectSharp.ThreeD.ParallelLightSource.ParallelLightSource (
            double intensity,
            NormalizedVector3D direction )
```

Creates a new ParallelLightSource instance.

Parameters

intensity	The intensity of the light.
direction	The direction along which the light travels.

Definition at line 151 of file Lights.cs.

7.108.3 Member Function Documentation

7.108.3.1 GetLightAt()

```
LightIntensity VectSharp.ThreeD.ParallelLightSource.GetLightAt (
            Point3D point )
```

Computes the light intensity at the specified point, without taking into account any obstructions.

Parameters

point	The Point3DElement at which the light intensity should be computed.

Returns

Implements VectSharp.ThreeD.ILightSource.

Definition at line 159 of file Lights.cs.

7.108.3.2 GetObstruction()

```
double VectSharp.ThreeD.ParallelLightSource.GetObstruction (
            Point3D point,
            IEnumerable< Triangle3DElement > shadowingTriangles )
```

Determines the amount of obstruction of the light that results at *point* due to the specified *shadowingTriangles* .

Parameters

point	The Point3D at which the obstruction should be computed.
shadowingTriangles	A collection of Triangle3DElement casting shadows.

Returns

1 if the light is completely obstructed, 0 if the light is completely visible, a value between these if the light is partially obstructed.

Implements VectSharp.ThreeD.ILightSource.

Definition at line 165 of file Lights.cs.

7.108.4 Property Documentation

7.108.4.1 CastsShadow

```
bool VectSharp.ThreeD.ParallelLightSource.CastsShadow = true  [get], [set]
```

Determines whether the light casts a shadow or not.

Implements VectSharp.ThreeD.ILightSource.

Definition at line 144 of file Lights.cs.

7.108.4.2 Direction

```
NormalizedVector3D VectSharp.ThreeD.ParallelLightSource.Direction  [get]
```

The direction along which the light travels.

Definition at line 136 of file Lights.cs.

7.108.4.3 Intensity

```
double VectSharp.ThreeD.ParallelLightSource.Intensity  [get], [set]
```

The intensity of the light.

Definition at line 131 of file Lights.cs.

7.108.4.4 ReverseDirection

```
NormalizedVector3D VectSharp.ThreeD.ParallelLightSource.ReverseDirection  [get]
```

The reverse of Direction.

Definition at line 141 of file Lights.cs.

The documentation for this class was generated from the following file:

- VectSharp.ThreeD/Lights.cs

7.109 VectSharp.SVG.Parser Class Reference

Contains methods to read an SVG image file.

Static Public Member Functions

- static Page ParseSVGURI (string uri, bool ignored=false)

  Parses an SVG image URI.
- static Page FromString (string svgSource)

  Parses SVG source into a Page containing the image represented by the code.
- static Page FromFile (string fileName)

  Parses an SVG image file into a Page containing the image.
- static Page FromStream (Stream svgSourceStream)

  Parses an stream containing SVG source code into a Page containing the image represented by the code.

Static Public Attributes

- static Func< string, bool, Page > ParseImageURI

  A function that takes as input an image URI and a boolean value indicating whether the image should be interpolated, and returns a Page object containing the image. By default, this is equal to ParseSVGURI, i.e. it is only able to parse SVG images. If you wish to enable the parsing of other formats, you should install the "VectSharp.MuPDFUtils" NuGet package and enable the parser in your program by doing something like:

7.109.1 Detailed Description

Contains methods to read an SVG image file.

Definition at line 35 of file SVGParser.cs.

7.109.2 Member Function Documentation

7.109.2.1 FromFile()

```
static Page VectSharp.SVG.Parser.FromFile (
            string fileName )  [static]
```

Parses an SVG image file into a Page containing the image.

Parameters

fileName	The path to the SVG image file.

Returns

A Page containing the image represented by the file.

Definition at line 200 of file SVGParser.cs.

7.109.2.2 FromStream()

```
static Page VectSharp.SVG.Parser.FromStream (
            Stream svgSourceStream )  [static]
```

Parses an stream containing SVG source code into a Page containing the image represented by the code.

Parameters

svgSourceStream	The stream containing SVG source code.

Returns

A Page containing the image represented by the *svgSourceStream* .

Definition at line 210 of file SVGParser.cs.

7.109.2.3 FromString()

```
static Page VectSharp.SVG.Parser.FromString (
            string svgSource )  [static]
```

Parses SVG source into a Page containing the image represented by the code.

Parameters

svgSource	The SVG source code.

Returns

A Page containing the image represented by the *svgSource* .

Definition at line 118 of file SVGParser.cs.

7.109.2.4 ParseSVGURI()

```
static Page VectSharp.SVG.Parser.ParseSVGURI (
            string uri,
            bool ignored = false )  [static]
```

Parses an SVG image URI.

Parameters

uri	The image URI to parse.
ignored	This value is ignored and is only needed for compatibility.

Returns

A Page containing the parsed SVG image, or null.

Definition at line 56 of file SVGParser.cs.

7.109.3 Member Data Documentation

7.109.3.1 ParseImageURI

```
Func<string, bool, Page> VectSharp.SVG.Parser.ParseImageURI  [static]
```

A function that takes as input an image URI and a boolean value indicating whether the image should be interpolated, and returns a Page object containing the image. By default, this is equal to ParseSVGURI, i.e. it is only able to parse SVG images. If you wish to enable the parsing of other formats, you should install the "VectSharp.Mu↩ PDFUtils" NuGet package and enable the parser in your program by doing something like:

```
VectSharp.SVG.Parser.ParseImageURI = VectSharp.MuPDFUtils.ImageURIParser.Parser(VectShar
```

Definition at line 48 of file SVGParser.cs.

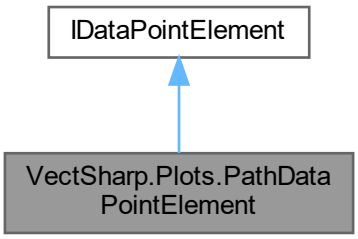
The documentation for this class was generated from the following file:

- VectSharp.SVG/SVGParser.cs

7.110 VectSharp.Plots.PathDataPointElement Class Reference

A symbol defined by a GraphicsPath.

Inheritance diagram for VectSharp.Plots.PathDataPointElement:



Public Member Functions

- void Plot (Graphics target, PlotElementPresentationAttributes presentationAttributes, string tag)

  Draw the symbol on the plot.

Parameters

target	*The Graphics object on which to draw. It is assumed that it has been transformed so that the symbol can be drawn centred at (0, 0)*
presentationAttributes	*Presentation attributes determining the appearance of the symbol.*
tag	*A tag to identify the symbol in the plot.*

- PathDataPointElement ()

  Create a new PathDataPointElement instance representing a circle.
- PathDataPointElement (GraphicsPath path)

  Create a new PathDataPointElement instance with the specified path .

Properties

- GraphicsPath Path = new GraphicsPath().Arc(0, 0, 1, 0, 2 * Math.PI).Close() `[get, set]`

  The GraphicsPath that constitutes the symbol (by default, a circle).

7.110.1 Detailed Description

A symbol defined by a GraphicsPath.

Definition at line 40 of file DataPoints.cs.

7.110.2 Constructor & Destructor Documentation

7.110.2.1 PathDataPointElement() [1/2]

```
VectSharp.Plots.PathDataPointElement.PathDataPointElement ( )
```

Create a new PathDataPointElement instance representing a circle.

Definition at line 79 of file DataPoints.cs.

7.110.2.2 PathDataPointElement() [2/2]

```
VectSharp.Plots.PathDataPointElement.PathDataPointElement (
            GraphicsPath path )
```

Create a new PathDataPointElement instance with the specified *path* .

Definition at line 87 of file DataPoints.cs.

7.110.3 Member Function Documentation

7.110.3.1 Plot()

```
void VectSharp.Plots.PathDataPointElement.Plot (
            Graphics target,
            PlotElementPresentationAttributes presentationAttributes,
            string tag )
```

Draw the symbol on the plot.

Parameters

target	The Graphics object on which to draw. It is assumed that it has been transformed so that the symbol can be drawn centred at (0, 0)
presentationAttributes	Presentation attributes determining the appearance of the symbol.
tag	A tag to identify the symbol in the plot.

Implements VectSharp.Plots.IDataPointElement.

Definition at line 48 of file DataPoints.cs.

7.110.4 Property Documentation

7.110.4.1 Path

```
GraphicsPath VectSharp.Plots.PathDataPointElement.Path = new GraphicsPath().Arc(0, 0, 1, 0, 2
* Math.PI).Close()  [get], [set]
```

The GraphicsPath that constitutes the symbol (by default, a circle).

Definition at line 45 of file DataPoints.cs.

The documentation for this class was generated from the following file:

- VectSharp.Plots/DataPoints.cs

7.111 VectSharp.PDF.PDFContextInterpreter Class Reference

Contains methods to render a Document as a PDF document.

Classes

- class FilterOption

  Determines how and whether image filters are rasterised.

Public Types

- enum TextOptions

  Defines whether the used fonts should be included in the file.

Static Public Member Functions

- static void SaveAsPDF (this Document document, string fileName, TextOptions textOption=TextOptions.↩ SubsetFonts, bool compressStreams=true, Dictionary< string, string > linkDestinations=null, FilterOption filterOption=default)

  Save the document to a PDF file.
- static void SaveAsPDF (this Document document, Stream stream, TextOptions textOption=TextOptions.↩ SubsetFonts, bool compressStreams=true, Dictionary< string, string > linkDestinations=null, FilterOption filterOption=default)

  Save the document to a PDF stream.

7.111.1 Detailed Description

Contains methods to render a Document as a PDF document.

Definition at line 831 of file PDFContext.cs.

7.111.2 Member Enumeration Documentation

7.111.2.1 TextOptions

```
enum VectSharp.PDF.PDFContextInterpreter.TextOptions
```

Defines whether the used fonts should be included in the file.

Definition at line 1126 of file PDFContext.cs.

7.111.3 Member Function Documentation

7.111.3.1 SaveAsPDF() [1/2]

```
static void VectSharp.PDF.PDFContextInterpreter.SaveAsPDF (
            this Document document,
            Stream stream,
            TextOptions textOption = TextOptions.SubsetFonts,
            bool compressStreams = true,
            Dictionary< string, string > linkDestinations = null,
            FilterOption filterOption = default )  [static]
```

Save the document to a PDF stream.

Parameters

document	The Document to save.
stream	The stream to which the PDF data will be written.
textOption	Defines whether the used fonts should be included in the file.
compressStreams	Indicates whether the streams in the PDF file should be compressed.
linkDestinations	A dictionary associating element tags to link targets. If this is provided, objects that have been drawn with a tag contained in the dictionary will become hyperlink to the destination specified in the dictionary. If the destination starts with a hash (#), it is interpreted as the tag of another object in the current document; otherwise, it is interpreted as an external URI.
filterOption	Defines how and whether image filters should be rasterised when rendering the image.

Definition at line 1210 of file PDFContext.cs.

7.111.3.2 SaveAsPDF() [2/2]

```
static void VectSharp.PDF.PDFContextInterpreter.SaveAsPDF (
            this Document document,
```

```
string fileName,
TextOptions textOption = TextOptions.SubsetFonts,
bool compressStreams = true,
Dictionary< string, string > linkDestinations = null,
FilterOption filterOption = default )  [static]
```

Save the document to a PDF file.

Parameters

document	The Document to save.
fileName	The full path to the file to save. If it exists, it will be overwritten.
textOption	Defines whether the used fonts should be included in the file.
compressStreams	Indicates whether the streams in the PDF file should be compressed.
linkDestinations	A dictionary associating element tags to link targets. If this is provided, objects that have been drawn with a tag contained in the dictionary will become hyperlink to the destination specified in the dictionary. If the destination starts with a hash (#), it is interpreted as the tag of another object in the current document; otherwise, it is interpreted as an external URI.
filterOption	Defines how and whether image filters should be rasterised when rendering the image.

Definition at line 1115 of file PDFContext.cs.

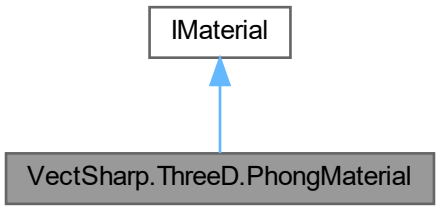
The documentation for this class was generated from the following file:

- VectSharp.PDF/PDFContext.cs

7.112 VectSharp.ThreeD.PhongMaterial Class Reference

Represents a material that uses a Phong reflection model to determine the colour of the material based on the light sources that hit it.

Inheritance diagram for VectSharp.ThreeD.PhongMaterial:



Public Member Functions

- PhongMaterial (Colour colour)

  Creates a new PhongMaterial instance.
- Colour GetColour (Point3D point, NormalizedVector3D surfaceNormal, Camera camera, IList< ILightSource > lights, IList< double > obstructions)

  Obtains the Colour at the specified point.

Parameters

point	*The point whose colour should be determined.*
surfaceNormal	*The normal to the surface at the specified point .*
camera	*The camera being used to render the scene.*
lights	*A list of light sources that are present in the scene.*
obstructions	*A list of values indicating how obstructed each light source is.*

Returns

The Colour of the specified point.

Properties

- Colour Colour `[get]`

  The base colour of the material.
- double AmbientReflectionCoefficient = 1 `[get, set]`

  A coefficient determining how much ambient light is reflected by the material.
- double DiffuseReflectionCoefficient = 1 `[get, set]`

  A coefficient determining how much directional light is reflected by the material.
- double SpecularReflectionCoefficient = 1 `[get, set]`

  A coefficient determining the intensity of specular highlights.
- double SpecularShininess = 1 `[get, set]`

  A coefficient determining the extent of specular highlights.

7.112.1 Detailed Description

Represents a material that uses a Phong reflection model to determine the colour of the material based on the light sources that hit it.

Definition at line 74 of file Materials.cs.

7.112.2 Constructor & Destructor Documentation

7.112.2.1 PhongMaterial()

```
VectSharp.ThreeD.PhongMaterial.PhongMaterial (
            Colour colour )
```

Creates a new PhongMaterial instance.

Parameters

colour	The base colour of the material.

Definition at line 111 of file Materials.cs.

7.112.3 Member Function Documentation

7.112.3.1 GetColour()

```
Colour VectSharp.ThreeD.PhongMaterial.GetColour (
            Point3D point,
            NormalizedVector3D surfaceNormal,
            Camera camera,
            IList< ILightSource > lights,
            IList< double > obstructions )
```

Obtains the Colour at the specified point.

Parameters

point	The point whose colour should be determined.
surfaceNormal	The normal to the surface at the specified *point* .
camera	The camera being used to render the scene.
lights	A list of light sources that are present in the scene.
obstructions	A list of values indicating how obstructed each light source is.

Returns

The Colour of the specified point.

Implements VectSharp.ThreeD.IMaterial.

Definition at line 142 of file Materials.cs.

7.112.4 Property Documentation

7.112.4.1 AmbientReflectionCoefficient

```
double VectSharp.ThreeD.PhongMaterial.AmbientReflectionCoefficient = 1  [get], [set]
```

A coefficient determining how much ambient light is reflected by the material.

Definition at line 90 of file Materials.cs.

7.112.4.2 Colour

```
Colour VectSharp.ThreeD.PhongMaterial.Colour  [get]
```

The base colour of the material.

Definition at line 79 of file Materials.cs.

7.112.4.3 DiffuseReflectionCoefficient

```
double VectSharp.ThreeD.PhongMaterial.DiffuseReflectionCoefficient = 1  [get], [set]
```

A coefficient determining how much directional light is reflected by the material.

Definition at line 95 of file Materials.cs.

7.112.4.4 SpecularReflectionCoefficient

```
double VectSharp.ThreeD.PhongMaterial.SpecularReflectionCoefficient = 1  [get], [set]
```

A coefficient determining the intensity of specular highlights.

Definition at line 100 of file Materials.cs.

7.112.4.5 SpecularShininess

```
double VectSharp.ThreeD.PhongMaterial.SpecularShininess = 1  [get], [set]
```

A coefficient determining the extent of specular highlights.

Definition at line 105 of file Materials.cs.

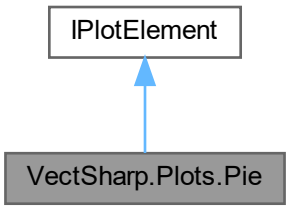
The documentation for this class was generated from the following file:

- VectSharp.ThreeD/Materials.cs

7.113 VectSharp.Plots.Pie Class Reference

A plot element that draws a pie or a doughnut.

Inheritance diagram for VectSharp.Plots.Pie:



Public Member Functions

- Pie (IReadOnlyList< double > data, IReadOnlyList< double > centre, IReadOnlyList< double > radius, ICoordinateSystem< IReadOnlyList< double > > coordinateSystem)

  Create a new Pie instance drawing a pie chart.
- Pie (IReadOnlyList< double > data, IReadOnlyList< double > centre, IReadOnlyList< double > innerRadius, IReadOnlyList< double > outerRadius, ICoordinateSystem< IReadOnlyList< double > > coordinateSystem)

  Create a new Pie instance drawing a doughnut chart.
- void Plot (Graphics target)

  Draw the plot element on the specified target Graphics.

Parameters

target	*The Graphics on which to draw.*

Properties

- IReadOnlyList< double > Data `[get, set]`

  The data in the pie chart. The values do not need to be normalised.
- IReadOnlyList< double > Centre `[get, set]`

  The centre of the pie/doughnut, in data coordinates.
- IReadOnlyList< double > OuterRadius `[get, set]`

  The outer radius of the pie/doughnut, in data coordinates.
- IReadOnlyList< double > InnerRadius `[get, set]`

  The inner radius of the doughnut, in data coordinates. Set to [0, 0] for a pie chart.
- double StartAngle = 0 `[get, set]`

  The initial angle starting from which the pie slices are drawn.
- bool Clockwise = false `[get, set]`

  Determines whether the slices are drawn in clockwise or anti-clockwise fashion.

- ICoordinateSystem< IReadOnlyList< double > > CoordinateSystem [get, set]

  The coordinate system used to transform the points from data space to plot space.
- IReadOnlyList< PlotElementPresentationAttributes > PresentationAttributes = new PlotElementPresentationAttributes[ ] { new PlotElementPresentationAttributes() } [get, set]

  Presentation attributes for the slices. An element from this collection is used for each slice in the pie/doughnut; if there are more slices than elements in this collection, the presentation attributes are wrapped.
- string Tag [get, set]

  A tag to identify the pie/doughnut in the plot.

7.113.1 Detailed Description

A plot element that draws a pie or a doughnut.

Definition at line 27 of file Pie.cs.

7.113.2 Constructor & Destructor Documentation

7.113.2.1 Pie() [1/2]

```
VectSharp.Plots.Pie.Pie (
            IReadOnlyList< double > data,
            IReadOnlyList< double > centre,
            IReadOnlyList< double > radius,
            ICoordinateSystem< IReadOnlyList< double > > coordinateSystem )
```

Create a new Pie instance drawing a pie chart.

Parameters

data	The data in the pie chart. The values do not need to be normalised.
centre	The centre of the pie, in data coordinates.
radius	The radius of the pie, in data coordinates.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 84 of file Pie.cs.

7.113.2.2 Pie() [2/2]

```
VectSharp.Plots.Pie.Pie (
            IReadOnlyList< double > data,
            IReadOnlyList< double > centre,
            IReadOnlyList< double > innerRadius,
            IReadOnlyList< double > outerRadius,
            ICoordinateSystem< IReadOnlyList< double > > coordinateSystem )
```

Create a new Pie instance drawing a doughnut chart.

Parameters

data	The data in the doughnut chart. The values do not need to be normalised.
centre	The centre of the doughnut, in data coordinates.
innerRadius	The inner radius of the doughnut, in data coordinates.
outerRadius	The outer radius of the doughnut, in data coordinates.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 101 of file Pie.cs.

7.113.3 Member Function Documentation

7.113.3.1 Plot()

```
void VectSharp.Plots.Pie.Plot (
            Graphics target )
```

Draw the plot element on the specified *target* Graphics.

Parameters

target	The Graphics on which to draw.

Implements VectSharp.Plots.IPlotElement.

Definition at line 111 of file Pie.cs.

7.113.4 Property Documentation

7.113.4.1 Centre

```
IReadOnlyList<double> VectSharp.Plots.Pie.Centre  [get], [set]
```

The centre of the pie/doughnut, in data coordinates.

Definition at line 37 of file Pie.cs.

7.113.4.2 Clockwise

```
bool VectSharp.Plots.Pie.Clockwise = false  [get], [set]
```

Determines whether the slices are drawn in clockwise or anti-clockwise fashion.

Definition at line 57 of file Pie.cs.

7.113.4.3 CoordinateSystem

```
ICoordinateSystem<IReadOnlyList<double> > VectSharp.Plots.Pie.CoordinateSystem  [get], [set]
```

The coordinate system used to transform the points from data space to plot space.

Implements VectSharp.Plots.IPlotElement.

Definition at line 62 of file Pie.cs.

7.113.4.4 Data

```
IReadOnlyList<double> VectSharp.Plots.Pie.Data  [get], [set]
```

The data in the pie chart. The values do not need to be normalised.

Definition at line 32 of file Pie.cs.

7.113.4.5 InnerRadius

```
IReadOnlyList<double> VectSharp.Plots.Pie.InnerRadius  [get], [set]
```

The inner radius of the doughnut, in data coordinates. Set to [0, 0] for a pie chart.

Definition at line 47 of file Pie.cs.

7.113.4.6 OuterRadius

```
IReadOnlyList<double> VectSharp.Plots.Pie.OuterRadius  [get], [set]
```

The outer radius of the pie/doughnut, in data coordinates.

Definition at line 42 of file Pie.cs.

7.113.4.7 PresentationAttributes

```
IReadOnlyList<PlotElementPresentationAttributes> VectSharp.Plots.Pie.PresentationAttributes
= new PlotElementPresentationAttributes[] { new PlotElementPresentationAttributes() }  [get],
[set]
```

Presentation attributes for the slices. An element from this collection is used for each slice in the pie/doughnut; if there are more slices than elements in this collection, the presentation attributes are wrapped.

Definition at line 70 of file Pie.cs.

7.113.4.8 StartAngle

```
double VectSharp.Plots.Pie.StartAngle = 0  [get], [set]
```

The initial angle starting from which the pie slices are drawn.

Definition at line 52 of file Pie.cs.

7.113.4.9 Tag

```
string VectSharp.Plots.Pie.Tag  [get], [set]
```

A tag to identify the pie/doughnut in the plot.

Definition at line 75 of file Pie.cs.

The documentation for this class was generated from the following file:

- VectSharp.Plots/Pie.cs

7.114 VectSharp.Plots.Plot Class Reference

Represents a collection of plot elements.

Public Types

- enum WhiskerType

  Describes the types of whiskers for a box plot.
- enum NormalisationMode

  Describes the kind of normalisation that is performed.

Public Member Functions

- void AddPlotElement (IPlotElement plotElement)

  Add the specified plot element to the plot.
- void AddPlotElements (IEnumerable< IPlotElement > plotElements)

  Add the specified plot elements to the plot.
- void AddPlotElements (params IPlotElement[] plotElements)

  Add the specified plot elements to the plot.
- void RemovePlotElement (IPlotElement plotElement)

  Remove the specified plot element from the plot.
- void Render (Graphics target)

  Render the plot on the specified target Graphics.
- T GetFirst< T > ()

  Get the first IPlotElement of the specified type, or the first ICoordinateSystem of the specified type.
- IEnumerable< T > GetAll< T > ()

  Get all IPlotElements of the specified type, or all ICoordinateSystems of the specified type.
- Page Render ()

  Render the plot to a suitably cropped Page object.
- Plot ()

  Create a new empty Plot.

Properties

- ImmutableList< IPlotElement > PlotElements = ImmutableList.Create<IPlotElement>() `[get]`

  The elements contained in the plot.

7.114.1 Detailed Description

Represents a collection of plot elements.

Definition at line 24 of file Plot.Area.cs.

7.114.2 Member Enumeration Documentation

7.114.2.1 NormalisationMode

`enum VectSharp.Plots.Plot.NormalisationMode`

Describes the kind of normalisation that is performed.

Definition at line 29 of file Plot.Histogram.cs.

7.114.2.2 WhiskerType

```
enum VectSharp.Plots.Plot.WhiskerType
```

Describes the types of whiskers for a box plot.

Definition at line 30 of file Plot.BoxPlot.cs.

7.114.3 Constructor & Destructor Documentation

7.114.3.1 Plot()

```
VectSharp.Plots.Plot.Plot ( )
```

Create a new empty Plot.

Definition at line 260 of file Plot.cs.

7.114.4 Member Function Documentation

7.114.4.1 AddPlotElement()

```
void VectSharp.Plots.Plot.AddPlotElement (
            IPlotElement plotElement )
```

Add the specified plot element to the plot.

Parameters

plotElement	The plot element to add.

Definition at line 154 of file Plot.cs.

7.114.4.2 AddPlotElements() [1/2]

```
void VectSharp.Plots.Plot.AddPlotElements (
            IEnumerable< IPlotElement > plotElements )
```

Add the specified plot elements to the plot.

Parameters

plotElements	The plot elements to add.

Definition at line 163 of file Plot.cs.

7.114.4.3 AddPlotElements() [2/2]

```
void VectSharp.Plots.Plot.AddPlotElements (
            params IPlotElement[] plotElements )
```

Add the specified plot elements to the plot.

Parameters

plotElements	The plot elements to add.

Definition at line 172 of file Plot.cs.

7.114.4.4 GetAll< T >()

```
IEnumerable< T > VectSharp.Plots.Plot.GetAll< T > ( )
```

Get all IPlotElements of the specified type, or all ICoordinateSystems of the specified type.

Template Parameters

T	The type of plot element or coordinate system to get.

Returns

All IPlotElements of the specified type, or all ICoordinateSystems of the specified type.

Type Constraints

T* : *class
T* : *IPlotElement

Definition at line 225 of file Plot.cs.

7.114.4.5 GetFirst< T >()

```
T VectSharp.Plots.Plot.GetFirst< T > ( )
```

Get the first IPlotElement of the specified type, or the first ICoordinateSystem of the specified type.

Template Parameters

T	The type of plot element or coordinate system to get.

Returns

The first IPlotElement of the specified type, or the first ICoordinateSystem of the specified type, or `null` if none could be found.

Type Constraints

T* : *class

Definition at line 203 of file Plot.cs.

7.114.4.6 RemovePlotElement()

```
void VectSharp.Plots.Plot.RemovePlotElement (
            IPlotElement plotElement )
```

Remove the specified plot element from the plot.

Parameters

plotElement	The plot element to remove.

Definition at line 181 of file Plot.cs.

7.114.4.7 Render() [1/2]

```
Page VectSharp.Plots.Plot.Render ( )
```

Render the plot to a suitably cropped Page object.

Returns

A Page object containing the rendered plot.

Definition at line 244 of file Plot.cs.

7.114.4.8 Render() [2/2]

```
void VectSharp.Plots.Plot.Render (
            Graphics target )
```

Render the plot on the specified *target* Graphics.

Parameters

target	The Graphics on which the plot should be drawn.

Definition at line 190 of file Plot.cs.

7.114.5 Property Documentation

7.114.5.1 PlotElements

```
ImmutableList<IPlotElement> VectSharp.Plots.Plot.PlotElements = ImmutableList.Create<IPlotElement>()
[get]
```

The elements contained in the plot.

Definition at line 148 of file Plot.cs.

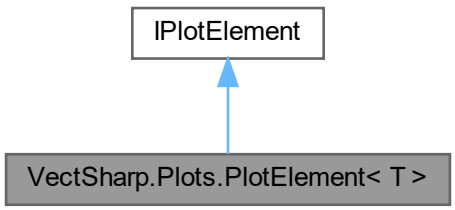
The documentation for this class was generated from the following files:

- VectSharp.Plots/Plot.Area.cs
- VectSharp.Plots/Plot.cs
- VectSharp.Plots/Plot.Histogram.cs

7.115 VectSharp.Plots.PlotElement< T > Class Template Reference

A plot element that uses an Action to draw its contents.

Inheritance diagram for VectSharp.Plots.PlotElement< T >:



Public Member Functions

- PlotElement (ICoordinateSystem< T > coordinateSystem, Action< Graphics, ICoordinateSystem< T > > plotAction)

  Create a new PlotElement< T > using the specified coordinate system and plot action.
- void Plot (Graphics target)

  Draw the plot element on the specified target Graphics.

Parameters

target	*The Graphics on which to draw.*

Properties

- Action< Graphics, ICoordinateSystem< T > > PlotAction `[get, set]`

  The action that is invoked when the plot element needs to be drawn.
- ICoordinateSystem< T > CoordinateSystem `[get, set]`

  The coordinate system used to transform the points from data space to plot space.

7.115.1 Detailed Description

A plot element that uses an Action to draw its contents.

Template Parameters

T	The type of data to plot (e.g. `double[]`).

Definition at line 109 of file Plot.cs.

7.115.2 Constructor & Destructor Documentation

7.115.2.1 PlotElement()

```
VectSharp.Plots.PlotElement< T >.PlotElement (
            ICoordinateSystem< T > coordinateSystem,
            Action< Graphics, ICoordinateSystem< T > > plotAction )
```

Create a new PlotElement<T> using the specified coordinate system and plot action.

Parameters

coordinateSystem	The coordinate system used to transform the points from data space to plot space.
plotAction	The action that is invoked when the plot element needs to be drawn.

Definition at line 127 of file Plot.cs.

7.115.3 Member Function Documentation

7.115.3.1 Plot()

```
void VectSharp.Plots.PlotElement< T >.Plot (
            Graphics target )
```

Draw the plot element on the specified *target* Graphics.

Parameters

target	The Graphics on which to draw.

Implements VectSharp.Plots.IPlotElement.

Definition at line 134 of file Plot.cs.

7.115.4 Property Documentation

7.115.4.1 CoordinateSystem

```
ICoordinateSystem<T> VectSharp.Plots.PlotElement< T >.CoordinateSystem  [get], [set]
```

The coordinate system used to transform the points from data space to plot space.

Implements VectSharp.Plots.IPlotElement.

Definition at line 119 of file Plot.cs.

7.115.4.2 PlotAction

```
Action<Graphics, ICoordinateSystem<T> > VectSharp.Plots.PlotElement< T >.PlotAction  [get],
[set]
```

The action that is invoked when the plot element needs to be drawn.

Definition at line 114 of file Plot.cs.

The documentation for this class was generated from the following file:

- VectSharp.Plots/Plot.cs

7.116 VectSharp.Plots.PlotElementPresentationAttributes Class Reference

Determines the appearance of plot elements.

Public Member Functions

- PlotElementPresentationAttributes ()

  Create a new PlotElementPresentationAttributes with the default values.
- PlotElementPresentationAttributes (PlotElementPresentationAttributes other)

  Creates a new PlotElementPresentationAttributes copying all settings from another instance.

Properties

- Brush Stroke = Colours.Black `[get, set]`

  The stroke of the plot element.
- Brush Fill = Colours.Black `[get, set]`

  The fill of the plot element.
- double LineWidth = 1 `[get, set]`

  The thickness of lines in the plot element.
- LineDash? LineDash = null `[get, set]`

  The line dash style for the plot element.
- LineCaps LineCap = LineCaps.Square `[get, set]`

  The line cap for the plot element.
- LineJoins LineJoin = LineJoins.Miter `[get, set]`

  The line join for the plot element.
- Font Font = new Font(FontFamily.ResolveFontFamily(FontFamily.StandardFontFamilies.Helvetica), 12) `[get, set]`

  The font used to draw text in the plot element.

7.116.1 Detailed Description

Determines the appearance of plot elements.

Definition at line 27 of file Plot.cs.

7.116.2 Constructor & Destructor Documentation

7.116.2.1 PlotElementPresentationAttributes() [1/2]

```
VectSharp.Plots.PlotElementPresentationAttributes.PlotElementPresentationAttributes ( )
```

Create a new PlotElementPresentationAttributes with the default values.

Definition at line 67 of file Plot.cs.

7.116.2.2 PlotElementPresentationAttributes() [2/2]

```
VectSharp.Plots.PlotElementPresentationAttributes.PlotElementPresentationAttributes (
            PlotElementPresentationAttributes other )
```

Creates a new PlotElementPresentationAttributes copying all settings from another instance.

Parameters

other	The other instance from which the settings will be copied.

Definition at line 76 of file Plot.cs.

7.116.3 Property Documentation

7.116.3.1 Fill

```
Brush VectSharp.Plots.PlotElementPresentationAttributes.Fill = Colours.Black  [get], [set]
```

The fill of the plot element.

Definition at line 37 of file Plot.cs.

7.116.3.2 Font

```
Font VectSharp.Plots.PlotElementPresentationAttributes.Font = new Font(FontFamily.ResolveFontFamily(Font↩
Family.StandardFontFamilies.Helvetica), 12)  [get], [set]
```

The font used to draw text in the plot element.

Definition at line 62 of file Plot.cs.

7.116.3.3 LineCap

```
LineCaps VectSharp.Plots.PlotElementPresentationAttributes.LineCap = LineCaps.Square  [get],
[set]
```

The line cap for the plot element.

Definition at line 52 of file Plot.cs.

7.116.3.4 LineDash

```
LineDash?  VectSharp.Plots.PlotElementPresentationAttributes.LineDash = null  [get], [set]
```

The line dash style for the plot element.

Definition at line 47 of file Plot.cs.

7.116.3.5 LineJoin

```
LineJoins VectSharp.Plots.PlotElementPresentationAttributes.LineJoin = LineJoins.Miter  [get], [set]
```

The line join for the plot element.

Definition at line 57 of file Plot.cs.

7.116.3.6 LineWidth

```
double VectSharp.Plots.PlotElementPresentationAttributes.LineWidth = 1  [get], [set]
```

The thickness of lines in the plot element.

Definition at line 42 of file Plot.cs.

7.116.3.7 Stroke

```
Brush VectSharp.Plots.PlotElementPresentationAttributes.Stroke = Colours.Black  [get], [set]
```

The stroke of the plot element.

Definition at line 32 of file Plot.cs.

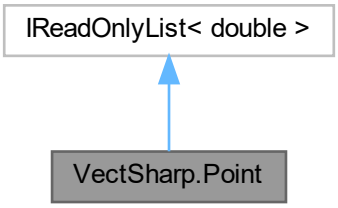
The documentation for this class was generated from the following file:

- VectSharp.Plots/Plot.cs

7.117 VectSharp.Point Struct Reference

Represents a point relative to an origin in the top-left corner.

Inheritance diagram for VectSharp.Point:



Public Member Functions

- Point (double x, double y)

  Create a new Point.
- double Modulus ()

  Computes the modulus of the vector represented by the Point.
- Point Normalize ()

  Normalises a Point.
- bool IsEqual (Point p2, double tolerance)

  Checks whether this Point is equal to another Point, up to a specified tolerance.
- IEnumerator< double > GetEnumerator ()
- IEnumerator IEnumerable. **GetEnumerator** ()

Static Public Member Functions

- static Point Min (Point p1, Point p2)

  Computes the top-left corner of the Rectangle identified by two Points.
- static Point Max (Point p1, Point p2)

  Computes the bottom-right corner of the Rectangle identified by two Points.
- static Rectangle Bounds (IEnumerable< Point > points)

  Computes the smallest Rectangle that contains all the specified points.
- static Rectangle Bounds (params Point[ ] points)

  Computes the smallest Rectangle that contains all the specified points.
- static implicit operator (double X, double Y)(Point point)

  Implicit conversion to a tuple.
- static implicit operator double[ ] (Point point)

  Implicit conversion to an array.
- static implicit operator Point ((double X, double Y) tuple)

  Implicit conversion from a tuple.
- static operator Point (double[ ] array)

  Explicit conversion from an array (will throw an exception if the array does not contain exactly two elements).
- static Point operator- (Point p1, Point p2)

  Subtract the coordinates of two points.
- static Point operator+ (Point p1, Point p2)

  Add the coordinates of two points.
- static Point operator* (double t, Point p)

  Multiply the coordinates of a point by a scalar.
- static Point operator* (Point p, double t)

  Multiply the coordinates of a point by a scalar.

Public Attributes

- double X

  Horizontal (x) coordinate, measured to the right of the origin.
- double Y

  Vertical (y) coordinate, measured to the bottom of the origin.

Properties

- int Count [get]
- double this[int index] [get]

7.117.1 Detailed Description

Represents a point relative to an origin in the top-left corner.

Definition at line 28 of file Point.cs.

7.117.2 Constructor & Destructor Documentation

7.117.2.1 Point()

```
VectSharp.Point.Point (
            double x,
            double y )
```

Create a new Point.

Parameters

x	The horizontal (x) coordinate.
y	The vertical (y) coordinate.

Definition at line 68 of file Point.cs.

7.117.3 Member Function Documentation

7.117.3.1 Bounds() [1/2]

```
static Rectangle VectSharp.Point.Bounds (
            IEnumerable< Point > points )  [static]
```

Computes the smallest Rectangle that contains all the specified points.

Parameters

points	The points whose bounds are being computed.

Returns

The smallest Rectangle that contains all the specified points.

Definition at line 131 of file Point.cs.

7.117.3.2 Bounds() [2/2]

```
static Rectangle VectSharp.Point.Bounds (
            params Point[] points )  [static]
```

Computes the smallest Rectangle that contains all the specified points.

Parameters

points	The points whose bounds are being computed.

Returns

The smallest Rectangle that contains all the specified points.

Definition at line 160 of file Point.cs.

7.117.3.3 GetEnumerator()

```
IEnumerator< double > VectSharp.Point.GetEnumerator ( )
```

Definition at line 166 of file Point.cs.

7.117.3.4 IsEqual()

```
bool VectSharp.Point.IsEqual (
            Point p2,
            double tolerance )
```

Checks whether this Point is equal to another Point, up to a specified tolerance.

Parameters

p2	The Point to compare.
tolerance	The tolerance threshold.

Returns

`true` if both coordinates of the Points are closer than *tolerance* or if their relative difference (i.e. `(a - b) / (a + b) * 2`) is smaller than *tolerance* . `false` otherwise.

Definition at line 99 of file Point.cs.

7.117.3.5 Max()

```
static Point VectSharp.Point.Max (
            Point p1,
            Point p2 )  [static]
```

Computes the bottom-right corner of the Rectangle identified by two Points.

Parameters

p1	The first point.
p2	The second point.

Returns

A Point whose X coordinate is the largest between the one of *p1* and *p2* , and likewise for the Y coordinate.

Definition at line 121 of file Point.cs.

7.117.3.6 Min()

```
static Point VectSharp.Point.Min (
            Point p1,
            Point p2 )  [static]
```

Computes the top-left corner of the Rectangle identified by two Points.

Parameters

p1	The first point.
p2	The second point.

Returns

A Point whose X coordinate is the smallest between the one of *p1* and *p2* , and likewise for the Y coordinate.

Definition at line 110 of file Point.cs.

7.117.3.7 Modulus()

```
double VectSharp.Point.Modulus ( )
```

Computes the modulus of the vector represented by the Point.

Returns

The modulus of the vector represented by the Point.

Definition at line 78 of file Point.cs.

7.117.3.8 Normalize()

```
Point VectSharp.Point.Normalize ( )
```

Normalises a Point.

Returns

The normalised Point.

Definition at line 87 of file Point.cs.

7.117.3.9 operator()

```
static implicit VectSharp.Point.operator (
            double X,
            double Y )  [static]
```

Implicit conversion to a tuple.

Parameters

point	The point to convert.

Definition at line 179 of file Point.cs.

7.117.3.10 operator double[]()

```
static implicit VectSharp.Point.operator double[] (
            Point point )  [static]
```

Implicit conversion to an array.

Parameters

point	The point to convert

Definition at line 188 of file Point.cs.

7.117.3.11 operator Point() [1/2]

```
static implicit VectSharp.Point.operator Point (
            (double X, double Y) tuple )  [static]
```

Implicit conversion from a tuple.

Parameters

tuple	The tuple to convert.

Definition at line 197 of file Point.cs.

7.117.3.12 operator Point() [2/2]

```
static VectSharp.Point.operator Point (
            double[] array )  [explicit], [static]
```

Explicit conversion from an array (will throw an exception if the array does not contain exactly two elements).

Parameters

array	The array to convert. It must contain exactly two elements.

Definition at line 206 of file Point.cs.

7.117.3.13 operator∗() [1/2]

```
static Point VectSharp.Point.operator* (
            double t,
            Point p )  [static]
```

Multiply the coordinates of a point by a scalar.

Parameters

t	The scalar.
p	The point.

Returns

A new Point whose coordinates are the product of the original points' and the scalar.

Definition at line 248 of file Point.cs.

7.117.3.14 operator∗() [2/2]

```
static Point VectSharp.Point.operator* (
            Point p,
            double t )  [static]
```

Multiply the coordinates of a point by a scalar.

Parameters

t	The scalar.
p	The point.

Returns

A new Point whose coordinates are the product of the original points' and the scalar.

Definition at line 259 of file Point.cs.

7.117.3.15 operator+()

```
static Point VectSharp.Point.operator+ (
            Point p1,
            Point p2 )  [static]
```

Add the coordinates of two points.

Parameters

p1	The first point.
p2	The second point.

Returns

A new Point whose coordinates are the sum of the coordinates of the original points.

Definition at line 237 of file Point.cs.

7.117.3.16 operator-()

```
static Point VectSharp.Point.operator- (
            Point p1,
            Point p2 )  [static]
```

Subtract the coordinates of two points.

Parameters

p1	The first point.
p2	The second point.

Returns

A new Point whose coordinates are the difference between the coordinates of the original points.

Definition at line 226 of file Point.cs.

7.117.4 Member Data Documentation

7.117.4.1 X

```
double VectSharp.Point.X
```

Horizontal (x) coordinate, measured to the right of the origin.

Definition at line 33 of file Point.cs.

7.117.4.2 Y

```
double VectSharp.Point.Y
```

Vertical (y) coordinate, measured to the bottom of the origin.

Definition at line 38 of file Point.cs.

7.117.5 Property Documentation

7.117.5.1 Count

```
int VectSharp.Point.Count  [get]
```

Definition at line 41 of file Point.cs.

7.117.5.2 this[int index]

```
double VectSharp.Point.this[int index]  [get]
```

Definition at line 44 of file Point.cs.

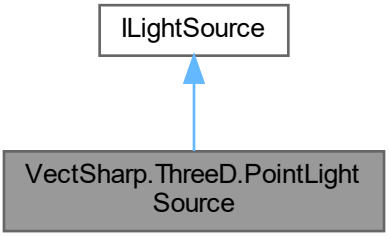
The documentation for this struct was generated from the following file:

- VectSharp/Point.cs

7.118 VectSharp.ThreeD.PointLightSource Class Reference

Represents a point light source.

Inheritance diagram for VectSharp.ThreeD.PointLightSource:



Public Member Functions

- PointLightSource (double intensity, Point3D position)

  Creates a new PointLightSource instance.
- LightIntensity GetLightAt (Point3D point)

  Computes the light intensity at the specified point, without taking into account any obstructions.

Parameters

point	*The Point3DElement at which the light intensity should be computed.*

Returns

- double GetObstruction (Point3D point, IEnumerable< Triangle3DElement > shadowingTriangles)

  Determines the amount of obstruction of the light that results at point due to the specified shadowingTriangles .

Parameters

point	*The Point3D at which the obstruction should be computed.*
shadowingTriangles	*A collection of Triangle3DElement casting shadows.*

Returns

1 if the light is completely obstructed, 0 if the light is completely visible, a value between these if the light is partially obstructed.

Properties

- bool CastsShadow = true `[get, set]`

  Determines whether the light casts a shadow or not.
- Point3D Position `[get, set]`

  The position of the light source.
- double Intensity `[get, set]`

  The base intensity of the light.
- double DistanceAttenuationExponent = 2 `[get, set]`

  An exponent determining how fast the light attenuates with increasing distance. Set to 0 to disable distance attenuation.

7.118.1 Detailed Description

Represents a point light source.

Definition at line 184 of file Lights.cs.

7.118.2 Constructor & Destructor Documentation

7.118.2.1 PointLightSource()

```
VectSharp.ThreeD.PointLightSource.PointLightSource (
            double intensity,
            Point3D position )
```

Creates a new PointLightSource instance.

Parameters

intensity	The intensity of the light.
position	The position of the light source.

Definition at line 209 of file Lights.cs.

7.118.3 Member Function Documentation

7.118.3.1 GetLightAt()

```
LightIntensity VectSharp.ThreeD.PointLightSource.GetLightAt (
            Point3D point )
```

Computes the light intensity at the specified point, without taking into account any obstructions.

Parameters

point	The Point3DElement at which the light intensity should be computed.

Returns

Implements VectSharp.ThreeD.ILightSource.

Definition at line 216 of file Lights.cs.

7.118.3.2 GetObstruction()

```
double VectSharp.ThreeD.PointLightSource.GetObstruction (
            Point3D point,
            IEnumerable< Triangle3DElement > shadowingTriangles )
```

Determines the amount of obstruction of the light that results at *point* due to the specified *shadowingTriangles* .

Parameters

point	The Point3D at which the obstruction should be computed.
shadowingTriangles	A collection of Triangle3DElement casting shadows.

Returns

1 if the light is completely obstructed, 0 if the light is completely visible, a value between these if the light is partially obstructed.

Implements VectSharp.ThreeD.ILightSource.

Definition at line 233 of file Lights.cs.

7.118.4 Property Documentation

7.118.4.1 CastsShadow

```
bool VectSharp.ThreeD.PointLightSource.CastsShadow = true  [get], [set]
```

Determines whether the light casts a shadow or not.

Implements VectSharp.ThreeD.ILightSource.

Definition at line 187 of file Lights.cs.

7.118.4.2 DistanceAttenuationExponent

```
double VectSharp.ThreeD.PointLightSource.DistanceAttenuationExponent = 2  [get], [set]
```

An exponent determining how fast the light attenuates with increasing distance. Set to 0 to disable distance attenuation.

Definition at line 202 of file Lights.cs.

7.118.4.3 Intensity

```
double VectSharp.ThreeD.PointLightSource.Intensity  [get], [set]
```

The base intensity of the light.

Definition at line 197 of file Lights.cs.

7.118.4.4 Position

```
Point3D VectSharp.ThreeD.PointLightSource.Position  [get], [set]
```

The position of the light source.

Definition at line 192 of file Lights.cs.

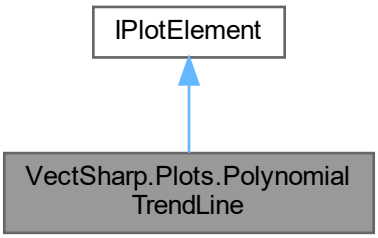
The documentation for this class was generated from the following file:

- VectSharp.ThreeD/Lights.cs

7.119 VectSharp.Plots.PolynomialTrendLine Class Reference

A plot element that draws a polynomial trendline with equation `y = a0 + a1 * x + a2 * x^2 + ... + aN * x^N`.

Inheritance diagram for VectSharp.Plots.PolynomialTrendLine:



Public Member Functions

- PolynomialTrendLine (double[] coefficients, double minX, double minY, double maxX, double maxY, IContinuousCoordinateSystem coordinateSystem)

  Create a new LinearTrendLine instance, specifying the coefficients.
- PolynomialTrendLine (IReadOnlyList< IReadOnlyList< double > > data, int order, IContinuousCoordinateSystem coordinateSystem, double? fixedIntercept=null)

  Create a new PolynomialTrendLine instance, determining the coefficients by running a regression.
- PolynomialTrendLine (IReadOnlyList<(double, double)> data, int order, IContinuousCoordinateSystem coordinateSystem, double? fixedIntercept=null)

  Create a new PolynomialTrendLine instance, determining the coefficients by running a regression.
- void Plot (Graphics target)

  Draw the plot element on the specified target Graphics.

Parameters

target	*The Graphics on which to draw.*

Properties

- double[] Coefficients `[get, set]`

  The coefficients (`a0 ... aN`).
- double MinX `[get, set]`

  The minimum X value for which the trendline is plotted.
- double MinY `[get, set]`

  The minimum Y value for which the trendline is plotted.
- double MaxX `[get, set]`

  The maximum X value for which the trendline is plotted.

- double MaxY `[get, set]`

  The maximum Y value for which the trendline is plotted.
- PlotElementPresentationAttributes PresentationAttributes = new PlotElementPresentationAttributes() { LineDash = new LineDash(5, 5, 0), Stroke = Colour.FromRgb(180, 180, 180) } `[get, set]`

  Presentation attributes for the trendline.
- string Tag `[get, set]`

  A tag to identify the trendline in the plot.
- IContinuousCoordinateSystem CoordinateSystem `[get, set]`

  The coordinate system used to transform the points from data space to plot space.

7.119.1 Detailed Description

A plot element that draws a polynomial trendline with equation `y = a0 + a1 * x + a2 * x^2 + ... + aN * x^N`.

Definition at line 685 of file Trendlines.cs.

7.119.2 Constructor & Destructor Documentation

7.119.2.1 PolynomialTrendLine() [1/3]

```
VectSharp.Plots.PolynomialTrendLine.PolynomialTrendLine (
            double[] coefficients,
            double minX,
            double minY,
            double maxX,
            double maxY,
            IContinuousCoordinateSystem coordinateSystem )
```

Create a new LinearTrendLine instance, specifying the coefficients.

Parameters

coefficients	The coefficients (`a0 ... aN`).
minX	The minimum X value for which the trendline is plotted.
minY	The minimum Y value for which the trendline is plotted.
maxX	The maximum X value for which the trendline is plotted.
maxY	The maximum Y value for which the trendline is plotted.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 736 of file Trendlines.cs.

7.119.2.2 PolynomialTrendLine() [2/3]

```
VectSharp.Plots.PolynomialTrendLine.PolynomialTrendLine (
```

```
IReadOnlyList< IReadOnlyList< double > > data,
int order,
IContinuousCoordinateSystem coordinateSystem,
double?  fixedIntercept = null )
```

Create a new PolynomialTrendLine instance, determining the coefficients by running a regression.

Parameters

data	The data that will be used to determine the coefficients.
order	The order of the polynomial (N). This must be ≥ 2.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.
fixedIntercept	If this is `null`, the intercept (a0) is determined during the regression; otherwise, it is fixed to the specified value.

Exceptions

ArgumentOutOfRangeException	Thrown if the *order* is < 2.

Definition at line 777 of file Trendlines.cs.

7.119.2.3 PolynomialTrendLine() [3/3]

```
VectSharp.Plots.PolynomialTrendLine.PolynomialTrendLine (
            IReadOnlyList<(double, double)> data,
            int order,
            IContinuousCoordinateSystem coordinateSystem,
            double?  fixedIntercept = null )
```

Create a new PolynomialTrendLine instance, determining the coefficients by running a regression.

Parameters

data	The data that will be used to determine the coefficients.
order	The order of the polynomial (N). This must be ≥ 2.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.
fixedIntercept	If this is `null`, the intercept (a0) is determined during the regression; otherwise, it is fixed to the specified value.

Exceptions

ArgumentOutOfRangeException	Thrown if the *order* is < 2.

Definition at line 830 of file Trendlines.cs.

7.119.3 Member Function Documentation

7.119.3.1 Plot()

```
void VectSharp.Plots.PolynomialTrendLine.Plot (
            Graphics target )
```

Draw the plot element on the specified *target* Graphics.

Parameters

target	The Graphics on which to draw.

Implements VectSharp.Plots.IPlotElement.

Definition at line 833 of file Trendlines.cs.

7.119.4 Property Documentation

7.119.4.1 Coefficients

```
double [] VectSharp.Plots.PolynomialTrendLine.Coefficients  [get], [set]
```

The coefficients (`a0 ... aN`).

Definition at line 690 of file Trendlines.cs.

7.119.4.2 CoordinateSystem

```
IContinuousCoordinateSystem VectSharp.Plots.PolynomialTrendLine.CoordinateSystem  [get], [set]
```

The coordinate system used to transform the points from data space to plot space.

Implements VectSharp.Plots.IPlotElement.

Definition at line 724 of file Trendlines.cs.

7.119.4.3 MaxX

```
double VectSharp.Plots.PolynomialTrendLine.MaxX  [get], [set]
```

The maximum X value for which the trendline is plotted.

Definition at line 704 of file Trendlines.cs.

7.119.4.4 MaxY

```
double VectSharp.Plots.PolynomialTrendLine.MaxY  [get], [set]
```

The maximum Y value for which the trendline is plotted.

Definition at line 709 of file Trendlines.cs.

7.119.4.5 MinX

```
double VectSharp.Plots.PolynomialTrendLine.MinX  [get], [set]
```

The minimum X value for which the trendline is plotted.

Definition at line 694 of file Trendlines.cs.

7.119.4.6 MinY

```
double VectSharp.Plots.PolynomialTrendLine.MinY  [get], [set]
```

The minimum Y value for which the trendline is plotted.

Definition at line 699 of file Trendlines.cs.

7.119.4.7 PresentationAttributes

```
PlotElementPresentationAttributes VectSharp.Plots.PolynomialTrendLine.PresentationAttributes =
new PlotElementPresentationAttributes() { LineDash = new LineDash(5, 5, 0), Stroke = Colour.FromRgb(180,
180, 180) }  [get], [set]
```

Presentation attributes for the trendline.

Definition at line 714 of file Trendlines.cs.

7.119.4.8 Tag

```
string VectSharp.Plots.PolynomialTrendLine.Tag  [get], [set]
```

A tag to identify the trendline in the plot.

Definition at line 719 of file Trendlines.cs.

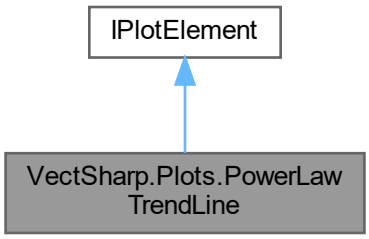
The documentation for this class was generated from the following file:

- VectSharp.Plots/Trendlines.cs

7.120 VectSharp.Plots.PowerLawTrendLine Class Reference

A plot element that draws a power law trendline with equation `y = b * x^a`.

Inheritance diagram for VectSharp.Plots.PowerLawTrendLine:



Public Member Functions

- PowerLawTrendLine (double slope, double intercept, double minX, double minY, double maxX, double maxY, IContinuousCoordinateSystem coordinateSystem)

  Create a new PowerLawTrendLine instance, specifying the equation parameters.
- PowerLawTrendLine (IReadOnlyList< IReadOnlyList< double > > data, IContinuousCoordinateSystem coordinateSystem)

  Create a new PowerLawTrendLine instance, determining the equation parameters by running a regression.
- PowerLawTrendLine (IReadOnlyList<(double, double)> data, IContinuousCoordinateSystem coordinate↩ System)

  Create a new PowerLawTrendLine instance, determining the equation parameters by running a regression.
- void Plot (Graphics target)

  Draw the plot element on the specified target Graphics.

Parameters

target	*The Graphics on which to draw.*

Properties

- double Slope `[get, set]`

  The slope of the trendline (a).
- double Intercept `[get, set]`

  The intercept of the trendline (b).
- double MinX `[get, set]`

  The minimum X value for which the trendline is plotted.
- double MinY `[get, set]`

  The minimum Y value for which the trendline is plotted.
- double MaxX `[get, set]`

The maximum X value for which the trendline is plotted.

- double MaxY `[get, set]`

  The maximum Y value for which the trendline is plotted.

- PlotElementPresentationAttributes PresentationAttributes = new PlotElementPresentationAttributes() { LineDash = new LineDash(5, 5, 0), Stroke = Colour.FromRgb(180, 180, 180) } `[get, set]`

  Presentation attributes for the trendline.

- string Tag `[get, set]`

  A tag to identify the trendline in the plot.

- IContinuousCoordinateSystem CoordinateSystem `[get, set]`

  The coordinate system used to transform the points from data space to plot space.

7.120.1 Detailed Description

A plot element that draws a power law trendline with equation `y = b * x^a`.

Definition at line 877 of file Trendlines.cs.

7.120.2 Constructor & Destructor Documentation

7.120.2.1 PowerLawTrendLine() [1/3]

```
VectSharp.Plots.PowerLawTrendLine.PowerLawTrendLine (
            double slope,
            double intercept,
            double minX,
            double minY,
            double maxX,
            double maxY,
            IContinuousCoordinateSystem coordinateSystem )
```

Create a new PowerLawTrendLine instance, specifying the equation parameters.

Parameters

slope	The slope of the trendline (a).
intercept	The intercept of the trendline (b).
minX	The minimum X value for which the trendline is plotted.
minY	The minimum Y value for which the trendline is plotted.
maxX	The maximum X value for which the trendline is plotted.
maxY	The maximum Y value for which the trendline is plotted.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 935 of file Trendlines.cs.

7.120.2.2 PowerLawTrendLine() [2/3]

```
VectSharp.Plots.PowerLawTrendLine.PowerLawTrendLine (
            IReadOnlyList< IReadOnlyList< double > > data,
            IContinuousCoordinateSystem coordinateSystem )
```

Create a new PowerLawTrendLine instance, determining the equation parameters by running a regression.

Parameters

data	The data that will be used to determine the equation parameters.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 951 of file Trendlines.cs.

7.120.2.3 PowerLawTrendLine() [3/3]

```
VectSharp.Plots.PowerLawTrendLine.PowerLawTrendLine (
            IReadOnlyList<(double, double)> data,
            IContinuousCoordinateSystem coordinateSystem )
```

Create a new PowerLawTrendLine instance, determining the equation parameters by running a regression.

Parameters

data	The data that will be used to determine the equation parameters.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 985 of file Trendlines.cs.

7.120.3 Member Function Documentation

7.120.3.1 Plot()

```
void VectSharp.Plots.PowerLawTrendLine.Plot (
            Graphics target )
```

Draw the plot element on the specified *target* Graphics.

Parameters

target	The Graphics on which to draw.

Implements VectSharp.Plots.IPlotElement.

Definition at line 988 of file Trendlines.cs.

7.120.4 Property Documentation

7.120.4.1 CoordinateSystem

```
IContinuousCoordinateSystem VectSharp.Plots.PowerLawTrendLine.CoordinateSystem  [get], [set]
```

The coordinate system used to transform the points from data space to plot space.

Implements VectSharp.Plots.IPlotElement.

Definition at line 922 of file Trendlines.cs.

7.120.4.2 Intercept

```
double VectSharp.Plots.PowerLawTrendLine.Intercept  [get], [set]
```

The intercept of the trendline (b).

Definition at line 887 of file Trendlines.cs.

7.120.4.3 MaxX

```
double VectSharp.Plots.PowerLawTrendLine.MaxX  [get], [set]
```

The maximum X value for which the trendline is plotted.

Definition at line 902 of file Trendlines.cs.

7.120.4.4 MaxY

```
double VectSharp.Plots.PowerLawTrendLine.MaxY  [get], [set]
```

The maximum Y value for which the trendline is plotted.

Definition at line 907 of file Trendlines.cs.

7.120.4.5 MinX

```
double VectSharp.Plots.PowerLawTrendLine.MinX  [get], [set]
```

The minimum X value for which the trendline is plotted.

Definition at line 892 of file Trendlines.cs.

7.120.4.6 MinY

```
double VectSharp.Plots.PowerLawTrendLine.MinY  [get], [set]
```

The minimum Y value for which the trendline is plotted.

Definition at line 897 of file Trendlines.cs.

7.120.4.7 PresentationAttributes

```
PlotElementPresentationAttributes VectSharp.Plots.PowerLawTrendLine.PresentationAttributes =
new PlotElementPresentationAttributes() { LineDash = new LineDash(5, 5, 0), Stroke = Colour.FromRgb(180,
180, 180) }  [get], [set]
```

Presentation attributes for the trendline.

Definition at line 912 of file Trendlines.cs.

7.120.4.8 Slope

```
double VectSharp.Plots.PowerLawTrendLine.Slope  [get], [set]
```

The slope of the trendline (a).

Definition at line 882 of file Trendlines.cs.

7.120.4.9 Tag

```
string VectSharp.Plots.PowerLawTrendLine.Tag  [get], [set]
```

A tag to identify the trendline in the plot.

Definition at line 917 of file Trendlines.cs.

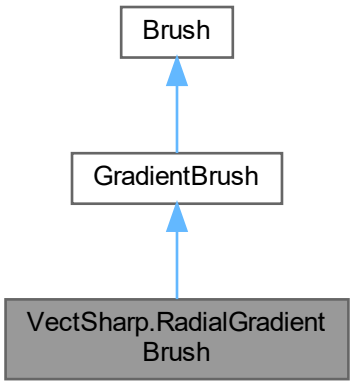
The documentation for this class was generated from the following file:

- VectSharp.Plots/Trendlines.cs

7.121 VectSharp.RadialGradientBrush Class Reference

Represents a brush painting with a radial gradient.

Inheritance diagram for VectSharp.RadialGradientBrush:



Public Member Functions

- RadialGradientBrush (Point focalPoint, Point centre, double radius, params GradientStop[ ] gradientStops)

  Creates a new RadialGradientBrush with the specified focal point, centre, radius and gradient stops.
- RadialGradientBrush (Point focalPoint, Point centre, double radius, IEnumerable< GradientStop > gradient↩ Stops)

  Creates a new RadialGradientBrush with the specified focal point, centre, radius and gradient stops.
- override Brush MultiplyOpacity (double opacity)

  Returns a brush corresponding the current instance, with the specified opacity multiplication applied.

Parameters

opacity	*The value that will be used to multiply the opacity of the brush.*

Returns

A brush corresponding the current instance, with the specified opacity multiplication applied.

Properties

- Point FocalPoint `[get]`

  The focal point of the gradient (i.e. the point within the circle where the gradient starts).
- Point Centre `[get]`

  Represents the centre of the gradient.
- double Radius `[get]`

  The radius of the gradient.

Additional Inherited Members

7.121.1 Detailed Description

Represents a brush painting with a radial gradient.

Definition at line 406 of file Brush.cs.

7.121.2 Constructor & Destructor Documentation

7.121.2.1 RadialGradientBrush() [1/2]

```
VectSharp.RadialGradientBrush.RadialGradientBrush (
            Point focalPoint,
            Point centre,
            double radius,
            params GradientStop[] gradientStops )
```

Creates a new RadialGradientBrush with the specified focal point, centre, radius and gradient stops.

Parameters

focalPoint	The focal point of the gradient. Note that this is relative to the current coordinate system when the gradient is used.
centre	The centre of the gradient. Note that this is relative to the current coordinate system when the gradient is used.
radius	The radius of the gradient. Note that this is relative to the current coordinate system when the gradient is used.
gradientStops	The colour stops in the gradient.

Definition at line 430 of file Brush.cs.

7.121.2.2 RadialGradientBrush() [2/2]

```
VectSharp.RadialGradientBrush.RadialGradientBrush (
            Point focalPoint,
            Point centre,
            double radius,
            IEnumerable< GradientStop > gradientStops )
```

Creates a new RadialGradientBrush with the specified focal point, centre, radius and gradient stops.

Parameters

focalPoint	The focal point of the gradient. Note that this is relative to the current coordinate system when the gradient is used.
centre	The centre of the gradient. Note that this is relative to the current coordinate system when the gradient is used.
radius	The radius of the gradient. Note that this is relative to the current coordinate system when the gradient is used.
gradientStops	The colour stops in the gradient.

Definition at line 469 of file Brush.cs.

7.121.3 Member Function Documentation

7.121.3.1 MultiplyOpacity()

```
override Brush VectSharp.RadialGradientBrush.MultiplyOpacity (
            double opacity )  [virtual]
```

Returns a brush corresponding the current instance, with the specified *opacity* multiplication applied.

Parameters

opacity	The value that will be used to multiply the opacity of the brush.

Returns

A brush corresponding the current instance, with the specified *opacity* multiplication applied.

Implements VectSharp.Brush.

Definition at line 502 of file Brush.cs.

7.121.4 Property Documentation

7.121.4.1 Centre

```
Point VectSharp.RadialGradientBrush.Centre  [get]
```

Represents the centre of the gradient.

Definition at line 416 of file Brush.cs.

7.121.4.2 FocalPoint

```
Point VectSharp.RadialGradientBrush.FocalPoint  [get]
```

The focal point of the gradient (i.e. the point within the circle where the gradient starts).

Definition at line 411 of file Brush.cs.

7.121.4.3 Radius

```
double VectSharp.RadialGradientBrush.Radius  [get]
```

The radius of the gradient.

Definition at line 421 of file Brush.cs.

7.123 VectSharp.Raster.Raster Class Reference

Contains methods to render a page to a PNG image.

Static Public Member Functions

- static void SaveAsPNG (this Page page, string fileName, double scale=1)

  Render the page to a PNG file.
- static void SaveAsPNG (this Page page, Stream stream, double scale=1)

  Render the page to a PNG stream.
- static RasterImage Rasterise (this Graphics graphics, Rectangle region, double scale, bool interpolate)

  Rasterise a region of a Graphics object.
- static DisposableIntPtr SaveAsRawBytes (this Page pag, out int width, out int height, out int totalSize, double scale=1)

  Render the page to raw pixel data, in 32bpp RGBA format.
- static void SaveAsAnimatedPNG (this Animation animation, Stream imageStream, double scale=1, double frameRate=60, double durationScaling=1, AnimatedPNG.InterframeCompression interframeCompression=AnimatedPNG.InterframeCompression.First)

  Saves the animation to a stream in animated PNG format.
- static void SaveAsAnimatedPNG (this Animation animation, string fileName, double scale=1, double frameRate=60, double durationScaling=1, AnimatedPNG.InterframeCompression interframeCompression=AnimatedPNG.InterframeCompression.First)

  Saves the animation to an animated PNG file.

7.123.1 Detailed Description

Contains methods to render a page to a PNG image.

Definition at line 30 of file Raster.cs.

7.123.2 Member Function Documentation

7.123.2.1 Rasterise()

```
static RasterImage VectSharp.Raster.Raster.Rasterise (
            this Graphics graphics,
            Rectangle region,
            double scale,
            bool interpolate )  [static]
```

Rasterise a region of a Graphics object.

Parameters

graphics	The Graphics object that will be rasterised.
region	The region of the *graphics* that will be rasterised.
scale	The scale at which the image will be rendered.
interpolate	Whether the resulting image should be interpolated or not when it is drawn on another Graphics surface.

Returns

A RasterImage containing the rasterised graphics.

Definition at line 91 of file Raster.cs.

7.123.2.2 SaveAsAnimatedPNG() [1/2]

```
static void VectSharp.Raster.Raster.SaveAsAnimatedPNG (
            this Animation animation,
            Stream imageStream,
            double scale = 1,
            double frameRate = 60,
            double durationScaling = 1,
            AnimatedPNG.InterframeCompression interframeCompression = AnimatedPNG.InterframeCompression.First
)  [static]
```

Saves the animation to a stream in animated PNG format.

Parameters

animation	The animation to export.
imageStream	The stream on which the animated PNG will be written.
scale	The scale at which the animation will be rendered.
frameRate	The target frame rate of the animation, in frames-per-second (fps). This is capped by the animated PNG specification at 90 fps.
durationScaling	A scaling factor that will be applied to all durations in the animation. Values greater than 1 slow down the animation, values smaller than 1 accelerate it. Note that this does not affect the frame rate of the animation.
interframeCompression	The kind of compression that will be used to reduce file size. Note that if the animation has a transparent background, no compression can be performed, and the value of this parameter is ignored.

Definition at line 184 of file Raster.cs.

7.123.2.3 SaveAsAnimatedPNG() [2/2]

```
static void VectSharp.Raster.Raster.SaveAsAnimatedPNG (
            this Animation animation,
            string fileName,
            double scale = 1,
            double frameRate = 60,
            double durationScaling = 1,
            AnimatedPNG.InterframeCompression interframeCompression = AnimatedPNG.InterframeCompression.First
)  [static]
```

Saves the animation to an animated PNG file.

Parameters

animation	The animation to export.
fileName	The output file to create.
scale	The scale at which the animation will be rendered.
frameRate	The target frame rate of the animation, in frames-per-second (fps). This is capped by the animated PNG specification at 90 fps.
durationScaling	A scaling factor that will be applied to all durations in the animation. Values greater than 1 slow down the animation, values smaller than 1 accelerate it. Note that this does not affect the frame rate of the animation.
interframeCompression	The kind of compression that will be used to reduce file size. Note that if the animation has a transparent background, no compression can be performed, and the value of this parameter is ignored.

Definition at line 267 of file Raster.cs.

7.123.2.4 SaveAsPNG() [1/2]

```
static void VectSharp.Raster.Raster.SaveAsPNG (
            this Page page,
            Stream stream,
            double scale = 1 )  [static]
```

Render the page to a PNG stream.

Parameters

page	The Page to render.
stream	The stream to which the PNG data will be written.
scale	The scale to be used when rasterising the page. This will determine the width and height of the image file.

Definition at line 64 of file Raster.cs.

7.123.2.5 SaveAsPNG() [2/2]

```
static void VectSharp.Raster.Raster.SaveAsPNG (
            this Page page,
            string fileName,
            double scale = 1 )  [static]
```

Render the page to a PNG file.

Parameters

page	The Page to render.
fileName	The full path to the file to save. If it exists, it will be overwritten.
scale	The scale to be used when rasterising the page. This will determine the width and height of the image file.

Definition at line 39 of file Raster.cs.

7.123.2.6 SaveAsRawBytes()

```
static DisposableIntPtr VectSharp.Raster.Raster.SaveAsRawBytes (
            this Page pag,
            out int width,
            out int height,
            out int totalSize,
            double scale = 1 )  [static]
```

Render the page to raw pixel data, in 32bpp RGBA format.

Parameters

pag	The Page to render.
scale	The scale to be used when rasterising the page. This will determine the width and height of the image.
width	The width of the rendered image.
height	The height of the rendered image.
totalSize	The size in bytes of the raw pixel data.

Returns

A DisposableIntPtr containing a pointer to the raw pixel data, stored in unmanaged memory. Dispose this object to release the unmanaged memory.

Definition at line 143 of file Raster.cs.

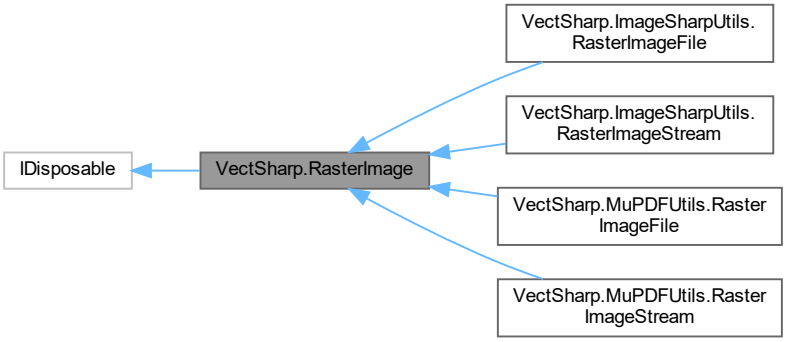
The documentation for this class was generated from the following file:

- VectSharp.Raster/Raster.cs

7.124 VectSharp.RasterImage Class Reference

Represents a raster image, created from raw pixel data. Consider using the derived classes included in the NuGet package "VectSharp.MuPDFUtils" if you need to load a raster image from a file or a Stream.

Inheritance diagram for VectSharp.RasterImage:



Public Member Functions

- RasterImage (IntPtr pixelData, int width, int height, bool hasAlpha, bool interpolate)

  Creates a new RasterImage instance from the specified pixel data in RGB or RGBA format.
- RasterImage (ref DisposableIntPtr pixelData, int width, int height, bool hasAlpha, bool interpolate)

  Creates a new RasterImage instance from the specified pixel data in RGB or RGBA format.
- RasterImage (byte[ ] data, int width, int height, PixelFormats pixelFormat, bool interpolate)

  Creates a new RasterImage instance copying the specified pixel data.
- void ClearPNGCache ()

  Disposes the PNGStream. Also useful if is is necessary to regenerate it, e.g. because the underlying image pixel data has changed.
- void Dispose ()

Properties

- IntPtr ImageDataAddress `[get]`

  The memory address of the image pixel data.
- IDisposable DataHolder `[get]`

  An IDisposable that will be disposed when the image is disposed.
- string Id `[get]`

  A univocal identifier for this image.
- bool HasAlpha `[get]`

  Determines whether the image has an alpha channel.
- int Width `[get]`

  The width in pixels of the image.
- int Height `[get]`

  The height in pixels of the image.
- bool Interpolate `[get]`

  Determines whether the image should be interpolated when it is resized.
- MemoryStream PNGStream `[get]`

  Contains a representation of the image in PNG format. Generated at the first access and cached until the image is disposed.

7.124.1 Detailed Description

Represents a raster image, created from raw pixel data. Consider using the derived classes included in the NuGet package "VectSharp.MuPDFUtils" if you need to load a raster image from a file or a Stream.

Definition at line 98 of file RasterImage.cs.

7.124.2 Constructor & Destructor Documentation

7.124.2.1 RasterImage() [1/3]

```
VectSharp.RasterImage.RasterImage (
            IntPtr pixelData,
            int width,
            int height,
            bool hasAlpha,
            bool interpolate )
```

Creates a new RasterImage instance from the specified pixel data in RGB or RGBA format.

Parameters

pixelData	The address of the image pixel data in RGB or RGBA format.
width	The width in pixels of the image.
height	The height in pixels of the image.
hasAlpha	true if the image is in RGBA format, false if it is in RGB format.
interpolate	Whether the image should be interpolated when it is resized.

Definition at line 170 of file RasterImage.cs.

7.124.2.2 RasterImage() [2/3]

```
VectSharp.RasterImage.RasterImage (
            ref DisposableIntPtr pixelData,
            int width,
            int height,
            bool hasAlpha,
            bool interpolate )
```

Creates a new RasterImage instance from the specified pixel data in RGB or RGBA format.

Parameters

pixelData	The address of the image pixel data in RGB or RGBA format wrapped in a DisposableIntPtr. The RasterImage will take ownership of this memory.

Parameters

width	The width in pixels of the image.
height	The height in pixels of the image.
hasAlpha	true if the image is in RGBA format, false if it is in RGB format.
interpolate	Whether the image should be interpolated when it is resized.

Definition at line 188 of file RasterImage.cs.

7.124.2.3 RasterImage() [3/3]

```
VectSharp.RasterImage.RasterImage (
            byte[] data,
            int width,
            int height,
            PixelFormats pixelFormat,
            bool interpolate )
```

Creates a new RasterImage instance copying the specified pixel data.

Parameters

data	The image pixel data that will be copied.
width	The width in pixels of the image.
height	The height in pixels of the image.
pixelFormat	The format of the pixel data.
interpolate	Whether the image should be interpolated when it is resized.

Definition at line 207 of file RasterImage.cs.

7.124.3 Member Function Documentation

7.124.3.1 ClearPNGCache()

```
void VectSharp.RasterImage.ClearPNGCache ( )
```

Disposes the PNGStream. Also useful if is is necessary to regenerate it, e.g. because the underlying image pixel data has changed.

Definition at line 261 of file RasterImage.cs.

7.124.3.2 Dispose()

```
void VectSharp.RasterImage.Dispose ( )
```

Definition at line 295 of file RasterImage.cs.

7.124.4 Property Documentation

7.124.4.1 DataHolder

```
IDisposable VectSharp.RasterImage.DataHolder  [get]
```

An IDisposable that will be disposed when the image is disposed.

Definition at line 108 of file RasterImage.cs.

7.124.4.2 HasAlpha

```
bool VectSharp.RasterImage.HasAlpha  [get]
```

Determines whether the image has an alpha channel.

Definition at line 118 of file RasterImage.cs.

7.124.4.3 Height

```
int VectSharp.RasterImage.Height  [get]
```

The height in pixels of the image.

Definition at line 128 of file RasterImage.cs.

7.124.4.4 Id

```
string VectSharp.RasterImage.Id  [get]
```

A univocal identifier for this image.

Definition at line 113 of file RasterImage.cs.

7.124.4.5 ImageDataAddress

```
IntPtr VectSharp.RasterImage.ImageDataAddress  [get]
```

The memory address of the image pixel data.

Definition at line 103 of file RasterImage.cs.

7.124.4.6 Interpolate

```
bool VectSharp.RasterImage.Interpolate  [get]
```

Determines whether the image should be interpolated when it is resized.

Definition at line 133 of file RasterImage.cs.

7.124.4.7 PNGStream

```
MemoryStream VectSharp.RasterImage.PNGStream  [get]
```

Contains a representation of the image in PNG format. Generated at the first access and cached until the image is disposed.

Definition at line 140 of file RasterImage.cs.

7.124.4.8 Width

```
int VectSharp.RasterImage.Width  [get]
```

The width in pixels of the image.

Definition at line 123 of file RasterImage.cs.

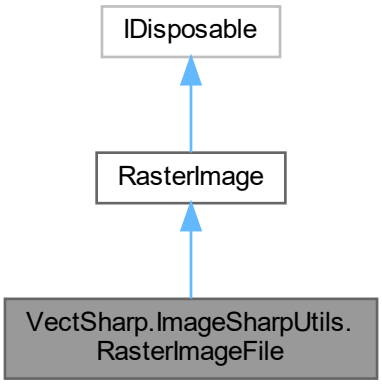
The documentation for this class was generated from the following file:

- VectSharp/RasterImage.cs

7.125 VectSharp.ImageSharpUtils.RasterImageFile Class Reference

A RasterImage created from a file.

Inheritance diagram for VectSharp.ImageSharpUtils.RasterImageFile:



Public Member Functions

- RasterImageFile (string fileName, bool alpha=true, bool interpolate=true)
  Creates a new RasterImage from the specified file.

Additional Inherited Members

7.125.1 Detailed Description

A RasterImage created from a file.

Definition at line 30 of file RasterImages.cs.

7.125.2 Constructor & Destructor Documentation

7.125.2.1 RasterImageFile()

```
VectSharp.ImageSharpUtils.RasterImageFile.RasterImageFile (
            string fileName,
            bool alpha = true,
            bool interpolate = true )
```

Creates a new RasterImage from the specified file.

Parameters

fileName	The path to the file containing the image.
alpha	A boolean value indicating whether transparency (alpha) data from the image should be preserved or not.
interpolate	A boolean value indicating whether the image should be interpolated when it is resized or not.

Definition at line 38 of file RasterImages.cs.

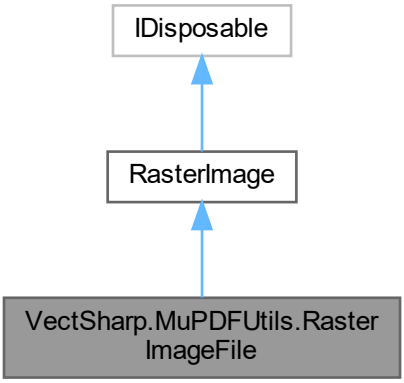
The documentation for this class was generated from the following file:

- VectSharp.ImageSharpUtils/RasterImages.cs

7.126 VectSharp.MuPDFUtils.RasterImageFile Class Reference

A RasterImage created from a file.

Inheritance diagram for VectSharp.MuPDFUtils.RasterImageFile:



Public Member Functions

- RasterImageFile (string fileName, int pageNumber=0, double scale=1, bool alpha=true, bool interpolate=true)

  Creates a new RasterImage from the specified file.

Additional Inherited Members

7.126.1 Detailed Description

A RasterImage created from a file.

Definition at line 28 of file RasterImages.cs.

7.126.2 Constructor & Destructor Documentation

7.126.2.1 RasterImageFile()

```
VectSharp.MuPDFUtils.RasterImageFile.RasterImageFile (
            string fileName,
            int pageNumber = 0,
            double scale = 1,
            bool alpha = true,
            bool interpolate = true )
```

Creates a new RasterImage from the specified file.

Parameters

fileName	The path to the file containing the image.
pageNumber	The number of the page in the file from which the image should be created, starting at 0. Only useful for multi-page formats, such as PDF.
scale	The scale factor at which to render the image.
alpha	A boolean value indicating whether transparency (alpha) data from the image should be preserved or not.
interpolate	A boolean value indicating whether the image should be interpolated when it is resized or not.

Definition at line 38 of file RasterImages.cs.

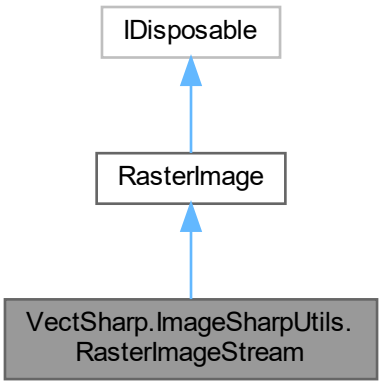
The documentation for this class was generated from the following file:

- VectSharp.MuPDFUtils/RasterImages.cs

7.127 VectSharp.ImageSharpUtils.RasterImageStream Class Reference

A RasterImage created from a stream.

Inheritance diagram for VectSharp.ImageSharpUtils.RasterImageStream:



Public Member Functions

- RasterImageStream (Stream imageStream, bool alpha=true, bool interpolate=true)

  Creates a new RasterImage from the specified stream.
- RasterImageStream (IntPtr imageAddress, int imageLength, bool alpha=true, bool interpolate=true)

  Creates a new RasterImage from the specified stream.

Additional Inherited Members

7.127.1 Detailed Description

A RasterImage created from a stream.

Definition at line 106 of file RasterImages.cs.

7.127.2 Constructor & Destructor Documentation

7.127.2.1 RasterImageStream() [1/2]

```
VectSharp.ImageSharpUtils.RasterImageStream.RasterImageStream (
            Stream imageStream,
            bool alpha = true,
            bool interpolate = true )
```

Creates a new RasterImage from the specified stream.

Parameters

imageStream	The stream containing the image data.
alpha	A boolean value indicating whether transparency (alpha) data from the image should be preserved or not.
interpolate	A boolean value indicating whether the image should be interpolated when it is resized or not.

Definition at line 114 of file RasterImages.cs.

7.127.2.2 RasterImageStream() [2/2]

```
VectSharp.ImageSharpUtils.RasterImageStream.RasterImageStream (
            IntPtr imageAddress,
            int imageLength,
            bool alpha = true,
            bool interpolate = true )
```

Creates a new RasterImage from the specified stream.

Parameters

imageAddress	A pointer to the address where the image data is contained.
imageLength	The length in bytes of the image data.
alpha	A boolean value indicating whether transparency (alpha) data from the image should be preserved or not.
interpolate	A boolean value indicating whether the image should be interpolated when it is resized or not.

Definition at line 185 of file RasterImages.cs.

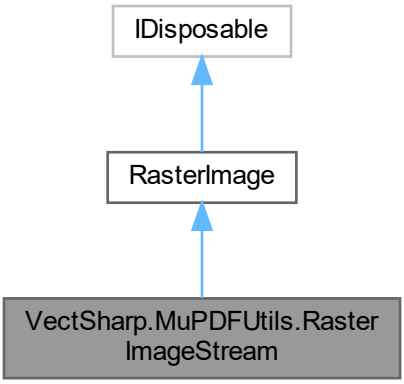
The documentation for this class was generated from the following file:

- VectSharp.ImageSharpUtils/RasterImages.cs

7.128 VectSharp.MuPDFUtils.RasterImageStream Class Reference

A RasterImage created from a stream.

Inheritance diagram for VectSharp.MuPDFUtils.RasterImageStream:



Public Member Functions

- RasterImageStream (Stream imageStream, InputFileTypes fileType, int pageNumber=0, double scale=1, bool alpha=true, bool interpolate=true)

  Creates a new RasterImage from the specified stream.
- RasterImageStream (IntPtr imageAddress, long imageLength, InputFileTypes fileType, int pageNumber=0, double scale=1, bool alpha=true, bool interpolate=true)

  Creates a new RasterImage from the specified stream.

Additional Inherited Members

7.128.1 Detailed Description

A RasterImage created from a stream.

Definition at line 69 of file RasterImages.cs.

7.128.2 Constructor & Destructor Documentation

7.128.2.1 RasterImageStream() [1/2]

```
VectSharp.MuPDFUtils.RasterImageStream.RasterImageStream (
            Stream imageStream,
            InputFileTypes fileType,
            int pageNumber = 0,
            double scale = 1,
            bool alpha = true,
            bool interpolate = true )
```

Creates a new RasterImage from the specified stream.

Parameters

imageStream	The stream containing the image data.
fileType	The type of the image contained in the stream.
pageNumber	The number of the page in the file from which the image should be created, starting at 0. Only useful for multi-page formats, such as PDF.
scale	The scale factor at which to render the image.
alpha	A boolean value indicating whether transparency (alpha) data from the image should be preserved or not.
interpolate	A boolean value indicating whether the image should be interpolated when it is resized or not.

Definition at line 80 of file RasterImages.cs.

7.128.2.2 RasterImageStream() [2/2]

```
VectSharp.MuPDFUtils.RasterImageStream.RasterImageStream (
            IntPtr imageAddress,
            long imageLength,
            InputFileTypes fileType,
            int pageNumber = 0,
            double scale = 1,
            bool alpha = true,
            bool interpolate = true )
```

Creates a new RasterImage from the specified stream.

Parameters

imageAddress	A pointer to the address where the image data is contained.
imageLength	The length in bytes of the image data.
fileType	The type of the image contained in the stream.
pageNumber	The number of the page in the file from which the image should be created, starting at 0. Only useful for multi-page formats, such as PDF.
scale	The scale factor at which to render the image.
alpha	A boolean value indicating whether transparency (alpha) data from the image should be preserved or not.
interpolate	A boolean value indicating whether the image should be interpolated when it is resized or not.

Definition at line 148 of file RasterImages.cs.

The documentation for this class was generated from the following file:

- VectSharp.MuPDFUtils/RasterImages.cs

7.129 VectSharp.Rectangle Struct Reference

Represents a rectangle.

Public Member Functions

- bool IsNaN ()

  Checks whether the rectangle is equivalent to Rectangle.NaN.
- Rectangle (Point location, Size size)

  Create a new Rectangle given its top-left corner and its size.
- Rectangle (double x, double y, double width, double height)

  Create a new Rectangle given its top-left corner and its size.
- Rectangle (Point topLeft, Point bottomRight)

  Create a new Rectangle given its top-left corner and its bottom-right corner.

Static Public Member Functions

- static Rectangle Union (Rectangle rectangle1, Rectangle rectangle2)

  Computes the rectangular bounds of the union of two Rectangles.
- static Rectangle Intersection (Rectangle rectangle1, Rectangle rectangle2)

  Computes the intersection of two Rectangles.
- static Rectangle Union (IEnumerable< Rectangle > rectangles)

  Computes the rectangular bounds of the union of multiple Rectangles.
- static Rectangle Union (params Rectangle[ ] rectangles)

  Computes the rectangular bounds of the union of multiple Rectangles.

Public Attributes

- Point Location

  The top-left corner of the rectangle.
- Size Size

  The size of the rectangle.

Static Public Attributes

- static readonly Rectangle NaN = new Rectangle(double.NaN, double.NaN, double.NaN, double.NaN)

  A rectangle whose dimensions are all double.NaN.

Properties

- Point Centre `[get]`

  The centre of the rectangle.

7.129.1 Detailed Description

Represents a rectangle.

Definition at line 295 of file Point.cs.

7.129.2 Constructor & Destructor Documentation

7.129.2.1 Rectangle() [1/3]

```
VectSharp.Rectangle.Rectangle (
            Point location,
            Size size )
```

Create a new Rectangle given its top-left corner and its size.

Parameters

location	The top-left corner of the rectangle.
size	The size of the rectangle.

Definition at line 331 of file Point.cs.

7.129.2.2 Rectangle() [2/3]

```
VectSharp.Rectangle.Rectangle (
            double x,
            double y,
            double width,
            double height )
```

Create a new Rectangle given its top-left corner and its size.

Parameters

x	The horizontal coordinate of the top-left corner of the rectangle.
y	The vertical coordinate of the top-left corner of the rectangle.
width	The width of the rectangle.
height	The height of the rectangle.

Definition at line 344 of file Point.cs.

7.129.2.3 Rectangle() [3/3]

```
VectSharp.Rectangle.Rectangle (
            Point topLeft,
            Point bottomRight )
```

Create a new Rectangle given its top-left corner and its bottom-right corner.

Parameters

topLeft	The top-left corner of the rectangle.
bottomRight	The bottom-right corner of the rectangle.

Definition at line 355 of file Point.cs.

7.129.3 Member Function Documentation

7.129.3.1 Intersection()

```
static Rectangle VectSharp.Rectangle.Intersection (
            Rectangle rectangle1,
            Rectangle rectangle2 )  [static]
```

Computes the intersection of two Rectangles.

Parameters

rectangle1	The first Rectangle.
rectangle2	The second Rectangle.

Returns

The rectangle corresponding to the intersection of *rectangle1* and *rectangle2* , or Rectangle.NaN if the intersection is empty.

Definition at line 400 of file Point.cs.

7.129.3.2 IsNaN()

```
bool VectSharp.Rectangle.IsNaN ( )
```

Checks whether the rectangle is equivalent to Rectangle.NaN.

Returns

`true` if all the dimensions of the rectangle are double.NaN, `false` otherwise.

Definition at line 306 of file Point.cs.

7.129.3.3 Union() [1/3]

```
static Rectangle VectSharp.Rectangle.Union (
            IEnumerable< Rectangle > rectangles )  [static]
```

Computes the rectangular bounds of the union of multiple Rectangles.

Parameters

rectangles	The Rectangles whose union will be computed.

Returns

The smallest Rectangle containing all the *rectangles* .

Definition at line 424 of file Point.cs.

7.129.3.4 Union() [2/3]

```
static Rectangle VectSharp.Rectangle.Union (
            params Rectangle[] rectangles )  [static]
```

Computes the rectangular bounds of the union of multiple Rectangles.

Parameters

rectangles	The Rectangles whose union will be computed.

Returns

The smallest Rectangle containing all the *rectangles* .

Definition at line 457 of file Point.cs.

7.129.3.5 Union() [3/3]

```
static Rectangle VectSharp.Rectangle.Union (
            Rectangle rectangle1,
            Rectangle rectangle2 )  [static]
```

Computes the rectangular bounds of the union of two Rectangles.

Parameters

rectangle1	The first Rectangle.
rectangle2	The second Rectangle.

Returns

The smallest Rectangle containing both *rectangle1* and *rectangle2* .

Definition at line 367 of file Point.cs.

7.129.4 Member Data Documentation

7.129.4.1 Location

```
Point VectSharp.Rectangle.Location
```

The top-left corner of the rectangle.

Definition at line 314 of file Point.cs.

7.129.4.2 NaN

```
readonly Rectangle VectSharp.Rectangle.NaN = new Rectangle(double.NaN, double.NaN, double.NaN,
double.NaN)  [static]
```

A rectangle whose dimensions are all double.NaN.

Definition at line 300 of file Point.cs.

7.129.4.3 Size

```
Size VectSharp.Rectangle.Size
```

The size of the rectangle.

Definition at line 319 of file Point.cs.

7.129.5 Property Documentation

7.129.5.1 Centre

```
Point VectSharp.Rectangle.Centre  [get]
```

The centre of the rectangle.

Definition at line 324 of file Point.cs.

The documentation for this struct was generated from the following file:

- VectSharp/Point.cs

7.130 VectSharp.Canvas.RenderAction Class Reference

Represents a light-weight rendering action.

Public Types

- enum ActionTypes

  Types of rendering actions.

Public Member Functions

- void BringToFront ()

  Brings the render action to the front of the rendering queue. This method can only be invoked after the output has been fully initialised.
- void SendToBack ()

  Brings the render action to the back of the rendering queue. This method can only be invoked after the output has been fully initialised.

Static Public Member Functions

- static RenderAction PathAction (Geometry geometry, Pen stroke, IBrush fill, Avalonia.Matrix transform, Geometry clippingPath, string tag=null)

  Creates a new RenderAction representing a path.
- static RenderAction TextAction (Avalonia.Media.FormattedText text, Avalonia.Media.TextFormatting.Text↩ Layout layout, IBrush fill, Avalonia.Matrix transform, Geometry clippingPath, string tag=null)

  Creates a new RenderAction representing text.
- static RenderAction ImageAction (string imageId, Avalonia.Rect sourceRect, Avalonia.Rect destinationRect, Avalonia.Matrix transform, Geometry clippingPath, string tag=null)

  Creates a new RenderAction representing an image.

Properties

- ActionTypes ActionType `[get]`

  Type of the rendering action.
- Geometry Geometry `[get, set]`

  Geometry that needs to be rendered (null if the action type is ActionTypes.Text). If you change this, you need to invalidate the Parent's visual.
- Avalonia.Media.FormattedText Text `[get, set]`

  Text that needs to be rendered (null if the action type is ActionTypes.Path). If you change this, you need to invalidate the Parent's visual and you should also change the Layout property.
- Avalonia.Media.TextFormatting.TextLayout Layout `[get, set]`

  Text layout, used for hit testing (null if the action type is ActionTypes.Path). If you change this, you need to invalidate the Parent's visual and you should also change the Text property.
- Pen Stroke `[get, set]`

  Rendering stroke (null if the action type is ActionTypes.Text or if the rendered action only has a Fill). If you change this, you need to invalidate the Parent's visual.
- IBrush Fill `[get, set]`

  Rendering fill (null if the rendered action only has a Stroke). If you change this, you need to invalidate the Parent's visual.
- string ImageId `[get, set]`

  Univocal identifier of the image that needs to be drawn.
- Avalonia.? Rect ImageSource `[get, set]`

  The source rectangle of the image.
- Avalonia.? Rect ImageDestination `[get, set]`

  The destination rectangle of the image.

- Geometry ClippingPath [get, set]

  The current clipping path.
- Avalonia.Matrix InverseTransform = Avalonia.Matrix.Identity [get]

  Inverse transformation matrix.
- Avalonia.Matrix Transform [get, set]

  Rendering transformation matrix. If you change this, you need to invalidate the Parent's visual.
- string Tag [get, set]

  A tag to access the RenderAction.
- Control Parent [get]

  The container of this RenderAction.

Events

- EventHandler< Avalonia.Input.PointerEventArgs > PointerEntered

  Raised when the pointer enters the area covered by the RenderAction.
- EventHandler< Avalonia.Input.PointerEventArgs > PointerExited

  Raised when the pointer leaves the area covered by the RenderAction.
- EventHandler< Avalonia.Input.PointerPressedEventArgs > PointerPressed

  Raised when the pointer is pressed while over the area covered by the RenderAction.
- EventHandler< Avalonia.Input.PointerReleasedEventArgs > PointerReleased

  Raised when the pointer is released after a PointerPressed event.

7.130.1 Detailed Description

Represents a light-weight rendering action.

Definition at line 1355 of file AvaloniaContext.cs.

7.130.2 Member Enumeration Documentation

7.130.2.1 ActionTypes

```
enum VectSharp.Canvas.RenderAction.ActionTypes
```

Types of rendering actions.

Definition at line 1360 of file AvaloniaContext.cs.

7.130.3 Member Function Documentation

7.130.3.1 BringToFront()

```
void VectSharp.Canvas.RenderAction.BringToFront ( )
```

Brings the render action to the front of the rendering queue. This method can only be invoked after the output has been fully initialised.

Definition at line 1608 of file AvaloniaContext.cs.

7.130.3.2 ImageAction()

```
static RenderAction VectSharp.Canvas.RenderAction.ImageAction (
            string imageId,
            Avalonia.Rect sourceRect,
            Avalonia.Rect destinationRect,
            Avalonia.Matrix transform,
            Geometry clippingPath,
            string tag = null )  [static]
```

Creates a new RenderAction representing an image.

Parameters

imageId	The univocal identifier of the image to draw.
sourceRect	The source rectangle of the image.
destinationRect	The destination rectangle of the image.
transform	The transform that will be applied to the image.
clippingPath	The clipping path.
tag	A tag to access the RenderAction. If this is null this RenderAction is not visible in the hit test.

Returns

A new RenderAction representing an image.

Definition at line 1591 of file AvaloniaContext.cs.

7.130.3.3 PathAction()

```
static RenderAction VectSharp.Canvas.RenderAction.PathAction (
            Geometry geometry,
            Pen stroke,
            IBrush fill,
            Avalonia.Matrix transform,
            Geometry clippingPath,
            string tag = null )  [static]
```

Creates a new RenderAction representing a path.

Parameters

geometry	The geometry to be rendered.
stroke	The stroke of the path (can be null).
fill	The fill of the path (can be null).
transform	The transform that will be applied to the path.
clippingPath	The clipping path.
tag	A tag to access the RenderAction. If this is null this RenderAction is not visible in the hit test.

Returns

A new RenderAction representing a path.

Definition at line 1542 of file AvaloniaContext.cs.

7.130.3.4 SendToBack()

```
void VectSharp.Canvas.RenderAction.SendToBack ( )
```

Brings the render action to the back of the rendering queue. This method can only be invoked after the output has been fully initialised.

Definition at line 1616 of file AvaloniaContext.cs.

7.130.3.5 TextAction()

```
static RenderAction VectSharp.Canvas.RenderAction.TextAction (
            Avalonia.Media.FormattedText text,
            Avalonia.Media.TextFormatting.TextLayout layout,
            IBrush fill,
            Avalonia.Matrix transform,
            Geometry clippingPath,
            string tag = null )  [static]
```

Creates a new RenderAction representing text.

Parameters

text	The text to be rendered.
layout	The text layout used for hit testing.
fill	The fill of the text (can be null).
transform	The transform that will be applied to the text.
clippingPath	The clipping path.
tag	A tag to access the RenderAction. If this is null this RenderAction is not visible in the hit test.

Returns

A new RenderAction representing text.

Definition at line 1566 of file AvaloniaContext.cs.

7.130.4 Property Documentation

7.130.4.1 ActionType

```
ActionTypes VectSharp.Canvas.RenderAction.ActionType  [get]
```

Type of the rendering action.

Definition at line 1381 of file AvaloniaContext.cs.

7.130.4.2 ClippingPath

```
Geometry VectSharp.Canvas.RenderAction.ClippingPath  [get], [set]
```

The current clipping path.

Definition at line 1446 of file AvaloniaContext.cs.

7.130.4.3 Fill

```
IBrush VectSharp.Canvas.RenderAction.Fill  [get], [set]
```

Rendering fill (null if the rendered action only has a Stroke). If you change this, you need to invalidate the Parent's visual.

Definition at line 1411 of file AvaloniaContext.cs.

7.130.4.4 Geometry

```
Geometry VectSharp.Canvas.RenderAction.Geometry  [get], [set]
```

Geometry that needs to be rendered (null if the action type is ActionTypes.Text). If you change this, you need to invalidate the Parent's visual.

Definition at line 1386 of file AvaloniaContext.cs.

7.130.4.5 ImageDestination

```
Avalonia.?  Rect VectSharp.Canvas.RenderAction.ImageDestination  [get], [set]
```

The destination rectangle of the image.

Definition at line 1441 of file AvaloniaContext.cs.

7.130.4.6 ImageId

```
string VectSharp.Canvas.RenderAction.ImageId  [get], [set]
```

Univocal identifier of the image that needs to be drawn.

Definition at line 1431 of file AvaloniaContext.cs.

7.130.4.7 ImageSource

```
Avalonia.?  Rect VectSharp.Canvas.RenderAction.ImageSource  [get], [set]
```

The source rectangle of the image.

Definition at line 1436 of file AvaloniaContext.cs.

7.130.4.8 InverseTransform

```
Avalonia.Matrix VectSharp.Canvas.RenderAction.InverseTransform = Avalonia.Matrix.Identity
[get]
```

Inverse transformation matrix.

Definition at line 1453 of file AvaloniaContext.cs.

7.130.4.9 Layout

```
Avalonia.Media.TextFormatting.TextLayout VectSharp.Canvas.RenderAction.Layout  [get], [set]
```

Text layout, used for hit testing (null if the action type is ActionTypes.Path). If you change this, you need to invalidate the Parent's visual and you should also change the Text property.

Definition at line 1398 of file AvaloniaContext.cs.

7.130.4.10 Parent

```
Control VectSharp.Canvas.RenderAction.Parent  [get]
```

The container of this RenderAction.

Definition at line 1478 of file AvaloniaContext.cs.

7.130.4.11 Stroke

```
Pen VectSharp.Canvas.RenderAction.Stroke  [get], [set]
```

Rendering stroke (null if the action type is ActionTypes.Text or if the rendered action only has a Fill). If you change this, you need to invalidate the Parent's visual.

Definition at line 1403 of file AvaloniaContext.cs.

7.130.4.12 Tag

```
string VectSharp.Canvas.RenderAction.Tag  [get], [set]
```

A tag to access the RenderAction.

Definition at line 1471 of file AvaloniaContext.cs.

7.130.4.13 Text

```
Avalonia.Media.FormattedText VectSharp.Canvas.RenderAction.Text  [get], [set]
```

Text that needs to be rendered (null if the action type is ActionTypes.Path). If you change this, you need to invalidate the Parent's visual and you should also change the Layout property.

Definition at line 1392 of file AvaloniaContext.cs.

7.130.4.14 Transform

```
Avalonia.Matrix VectSharp.Canvas.RenderAction.Transform  [get], [set]
```

Rendering transformation matrix. If you change this, you need to invalidate the Parent's visual.

Definition at line 1458 of file AvaloniaContext.cs.

7.130.5 Event Documentation

7.130.5.1 PointerEntered

```
EventHandler<Avalonia.Input.PointerEventArgs> VectSharp.Canvas.RenderAction.PointerEntered
```

Raised when the pointer enters the area covered by the RenderAction.

Definition at line 1489 of file AvaloniaContext.cs.

7.130.5.2 PointerExited

```
EventHandler<Avalonia.Input.PointerEventArgs> VectSharp.Canvas.RenderAction.PointerExited
```

Raised when the pointer leaves the area covered by the RenderAction.

Definition at line 1494 of file AvaloniaContext.cs.

7.130.5.3 PointerPressed

```
EventHandler<Avalonia.Input.PointerPressedEventArgs> VectSharp.Canvas.RenderAction.Pointer↩
Pressed
```

Raised when the pointer is pressed while over the area covered by the RenderAction.

Definition at line 1499 of file AvaloniaContext.cs.

7.130.5.4 PointerReleased

```
EventHandler<Avalonia.Input.PointerReleasedEventArgs> VectSharp.Canvas.RenderAction.Pointer↩
Released
```

Raised when the pointer is released after a PointerPressed event.

Definition at line 1504 of file AvaloniaContext.cs.

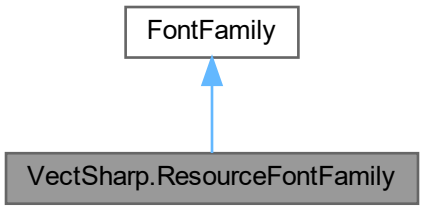
- VectSharp.Canvas/AvaloniaContext.cs

7.131 VectSharp.ResourceFontFamily Class Reference

Represents a FontFamily created from a resource stream.

Inheritance diagram for VectSharp.ResourceFontFamily:



Public Member Functions

- ResourceFontFamily (System.IO.Stream resourceStream, string resourceName)

  Create a new ResourceFontFamily from the specified resourceStream containing a TTF file, passing the specified resourceName to the

Public Attributes

- string ResourceName

  The name of the embedded resource, which will be parsed using

Additional Inherited Members

7.131.1 Detailed Description

Represents a FontFamily created from a resource stream.

Definition at line 694 of file Font.cs.

7.131.2 Constructor & Destructor Documentation

7.131.2.1 ResourceFontFamily()

```
VectSharp.ResourceFontFamily.ResourceFontFamily (
            System.IO.Stream resourceStream,
            string resourceName )
```

Create a new ResourceFontFamily from the specified *resourceStream* containing a TTF file, passing the specified *resourceName* to the

`Avalonia.Media.FontFamily.Parse(string, Uri)"</code> method. </summary>
<param name="resourceStream">A resource stream containing a TTF file.</param>
<param name="resourceName">The name of the embedded resource, which will be parsed using Avalonia.Media.FontFamily.Parse(string, Uri).`

Definition at line 706 of file Font.cs.

7.131.3 Member Data Documentation

7.131.3.1 ResourceName

```
string VectSharp.ResourceFontFamily.ResourceName
```

The name of the embedded resource, which will be parsed using

`Avalonia.Media.FontFamily.Parse(string, Uri).`

Definition at line 699 of file Font.cs.

The documentation for this class was generated from the following file:

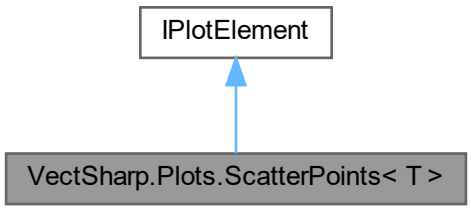
7.132 VectSharp.Plots.ScatterPoints< T > Class Template Reference

A plot element that draws a symbol at the location of multiple data points.

Inheritance diagram for VectSharp.Plots.ScatterPoints< T >:



Public Member Functions

- ScatterPoints (IEnumerable< T > data, ICoordinateSystem< T > coordinateSystem)

  Creates a new ScatterPoints< T > instance, using the specified data and coordinateSystem .
- void Plot (Graphics target)

  Draw the plot element on the specified target Graphics.

Parameters

target	*The Graphics on which to draw.*

Properties

- IEnumerable< T > Data `[get, set]`

  The data points at which the symbols will be drawn.
- double Size = 2 `[get, set]`

  The size of the symbols to draw, in plot coordinates.
- IDataPointElement DataPointElement = new PathDataPointElement() `[get, set]`

  The symbol that will be drawn (by default, a circle).
- ICoordinateSystem< T > CoordinateSystem `[get, set]`

  The coordinate system used to transform the points from data space to plot space.
- PlotElementPresentationAttributes PresentationAttributes = new PlotElementPresentationAttributes() `[get, set]`

  Presentation attributes determining the appearance (stroke and fill colour, etc.) of the symbols.
- string Tag `[get, set]`

  A tag to identify the symbols in the plot.

7.132.1 Detailed Description

A plot element that draws a symbol at the location of multiple data points.

Template Parameters

T	The kind of data describing the data points (generally, `IReadOnlyList<double>`).

Definition at line 150 of file DataPoints.cs.

7.132.2 Constructor & Destructor Documentation

7.132.2.1 ScatterPoints()

```
VectSharp.Plots.ScatterPoints< T >.ScatterPoints (
            IEnumerable< T > data,
            ICoordinateSystem< T > coordinateSystem )
```

Creates a new ScatterPoints<T> instance, using the specified *data* and *coordinateSystem* .

Parameters

data	The data points at which the symbols will be drawn.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 188 of file DataPoints.cs.

7.132.3 Member Function Documentation

7.132.3.1 Plot()

```
void VectSharp.Plots.ScatterPoints< T >.Plot (
            Graphics target )
```

Draw the plot element on the specified *target* Graphics.

Parameters

target	The Graphics on which to draw.

Implements VectSharp.Plots.IPlotElement.

Definition at line 195 of file DataPoints.cs.

7.132.4 Property Documentation

7.132.4.1 CoordinateSystem

```
ICoordinateSystem<T> VectSharp.Plots.ScatterPoints< T >.CoordinateSystem  [get], [set]
```

The coordinate system used to transform the points from data space to plot space.

Implements VectSharp.Plots.IPlotElement.

Definition at line 170 of file DataPoints.cs.

7.132.4.2 Data

```
IEnumerable<T> VectSharp.Plots.ScatterPoints< T >.Data  [get], [set]
```

The data points at which the symbols will be drawn.

Definition at line 155 of file DataPoints.cs.

7.132.4.3 DataPointElement

```
IDataPointElement VectSharp.Plots.ScatterPoints< T >.DataPointElement = new PathDataPointElement()
[get], [set]
```

The symbol that will be drawn (by default, a circle).

Definition at line 165 of file DataPoints.cs.

7.132.4.4 PresentationAttributes

```
PlotElementPresentationAttributes VectSharp.Plots.ScatterPoints< T >.PresentationAttributes =
new PlotElementPresentationAttributes()  [get], [set]
```

Presentation attributes determining the appearance (stroke and fill colour, etc.) of the symbols.

Definition at line 176 of file DataPoints.cs.

7.132.4.5 Size

```
double VectSharp.Plots.ScatterPoints< T >.Size = 2  [get], [set]
```

The size of the symbols to draw, in plot coordinates.

Definition at line 160 of file DataPoints.cs.

7.132.4.6 Tag

```
string VectSharp.Plots.ScatterPoints< T >.Tag  [get], [set]
```

A tag to identify the symbols in the plot.

Definition at line 181 of file DataPoints.cs.

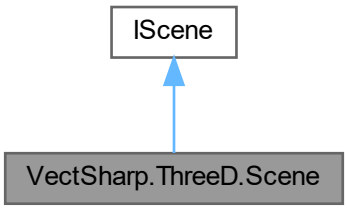
The documentation for this class was generated from the following file:

- VectSharp.Plots/DataPoints.cs

7.133 VectSharp.ThreeD.Scene Class Reference

Represents a 3D scene.

Inheritance diagram for VectSharp.ThreeD.Scene:



Public Member Functions

- Scene ()

  Creates a new Scene.
- void AddElement (Element3D element)

  Adds the specified element to the scene.

Parameters

element	*The Element3D to add.*

- void AddRange (IEnumerable< Element3D > elements)

  Adds the specified elements to the scene.

Parameters

elements	*A collection of Element3Ds to add.*

- void Replace (Func< Element3D, Element3D > replacementFunction)

  Replaces each element in the scene with the element returned by the replacementFunction .

Parameters

replacementFunction	*A function replacing each Element3D in the scene with another Element3D.*

- void Replace (Func< Element3D, IEnumerable< Element3D > > replacementFunction)

  Replaces each element in the scene with the element(s) returned by the replacementFunction .

Parameters

replacementFunction	*A function replacing each Element3D in the scene with 0 or more Element3Ds.*

Properties

- object SceneLock [get]

  An object used to synchronise multithreaded rendering of the same scene.
- IEnumerable< Element3D > SceneElements [get]

  The Element3Ds constituting the scene.

7.133.1 Detailed Description

Represents a 3D scene.

Definition at line 66 of file Scene.cs.

7.133.2 Constructor & Destructor Documentation

7.133.2.1 Scene()

```
VectSharp.ThreeD.Scene.Scene ( )
```

Creates a new Scene.

Definition at line 79 of file Scene.cs.

7.133.3 Member Function Documentation

7.133.3.1 AddElement()

```
void VectSharp.ThreeD.Scene.AddElement (
            Element3D element )
```

Adds the specified *element* to the scene.

Parameters

element	The Element3D to add.

Implements VectSharp.ThreeD.IScene.

Definition at line 86 of file Scene.cs.

7.133.3.2 AddRange()

```
void VectSharp.ThreeD.Scene.AddRange (
            IEnumerable< Element3D > elements )
```

Adds the specified *elements* to the scene.

Parameters

elements	A collection of Element3Ds to add.

Implements VectSharp.ThreeD.IScene.

Definition at line 92 of file Scene.cs.

7.133.3.3 Replace() [1/2]

```
void VectSharp.ThreeD.Scene.Replace (
            Func< Element3D, Element3D > replacementFunction )
```

Replaces each element in the scene with the element returned by the *replacementFunction* .

Parameters

replacementFunction	A function replacing each Element3D in the scene with another Element3D.

Implements VectSharp.ThreeD.IScene.

Definition at line 98 of file Scene.cs.

7.133.3.4 Replace() [2/2]

```
void VectSharp.ThreeD.Scene.Replace (
            Func< Element3D, IEnumerable< Element3D > > replacementFunction )
```

Replaces each element in the scene with the element(s) returned by the *replacementFunction* .

Parameters

replacementFunction	A function replacing each Element3D in the scene with 0 or more Element3Ds.

Implements VectSharp.ThreeD.IScene.

Definition at line 107 of file Scene.cs.

7.133.4 Property Documentation

7.133.4.1 SceneElements

```
IEnumerable<Element3D> VectSharp.ThreeD.Scene.SceneElements  [get]
```

The Element3Ds constituting the scene.

Implements VectSharp.ThreeD.IScene.

Definition at line 74 of file Scene.cs.

7.133.4.2 SceneLock

```
object VectSharp.ThreeD.Scene.SceneLock  [get]
```

An object used to synchronise multithreaded rendering of the same scene.

Implements VectSharp.ThreeD.IScene.

Definition at line 69 of file Scene.cs.

The documentation for this class was generated from the following file:

- VectSharp.ThreeD/Scene.cs

7.134 VectSharp.Segment Class Reference

Represents a segment as part of a GraphicsPath.

Public Member Functions

- abstract Segment Clone ()

  Creates a copy of the Segment.
- abstract double Measure (Point previousPoint)

  Computes the length of the Segment.
- abstract Point GetPointAt (Point previousPoint, double position)

  Gets the point on the Segment at the specified (relative) position).
- abstract Point GetTangentAt (Point previousPoint, double position)

  Gets the tangent to the Segment at the specified (relative) position).
- abstract IEnumerable< Segment > Linearise (Point? previousPoint, double resolution)

  Transform the segment into a series of linear segments. Segments that are already linear are not changed.
- abstract IEnumerable< Point > GetLinearisationTangents (Point? previousPoint, double resolution)

  Gets the tanget at the points at which the segment would be linearised.
- abstract IEnumerable< Segment > Transform (Func< Point, Point > transformationFunction)

  Applies an arbitrary transformation to all of the points of the Segment.
- abstract IEnumerable< Segment > Flatten (Point? previousPoint, double flatness)

  Flattens the Segment, replacing curve segments with series of line segments that approximate them, ensuring the specified maximum deviation from the original path.
- abstract IEnumerable<(Point point, Point tangent)> FlattenForOffsetAndGetTangents (Point? previousPoint, double offset, double flatness)

  Flattens the Segment, replacing curve segments with series of line segments that approximate them, ensuring the specified maximum deviation from the original path, assuming that the Segment will be drawn with the specified offset .

Properties

- abstract SegmentType Type [get]

  The type of the Segment.
- Point[] Points [get]

  The points used to define the Segment.
- virtual Point Point [get]

  The end point of the Segment.

7.134.1 Detailed Description

Represents a segment as part of a GraphicsPath.

Definition at line 28 of file Segment.cs.

7.134.2 Member Function Documentation

7.134.2.1 Clone()

```
abstract Segment VectSharp.Segment.Clone ( )  [pure virtual]
```

Creates a copy of the Segment.

Returns

A copy of the Segment.

7.134.2.2 Flatten()

```
abstract IEnumerable< Segment > VectSharp.Segment.Flatten (
            Point?  previousPoint,
            double flatness )  [pure virtual]
```

Flattens the Segment, replacing curve segments with series of line segments that approximate them, ensuring the specified maximum deviation from the original path.

Parameters

previousPoint	The point from which the Segment starts (i.e. the endpoint of the previous Segment).
flatness	The maximum deviation from the original path.

Returns

A collection of Segments composed only of linear segments that approximates the current Segment.

7.134.2.3 FlattenForOffsetAndGetTangents()

```
abstract IEnumerable<(Point point, Point tangent)> VectSharp.Segment.FlattenForOffsetAndGet↩
Tangents (
            Point?  previousPoint,
            double offset,
            double flatness )  [pure virtual]
```

Flattens the Segment, replacing curve segments with series of line segments that approximate them, ensuring the specified maximum deviation from the original path, assuming that the Segment will be drawn with the specified *offset* .

Parameters

previousPoint	The point from which the Segment starts (i.e. the endpoint of the previous Segment).
offset	The offset that will be used to draw the Segment (e.g., the line width of the stroke).
flatness	The maximum deviation from the original path.

Returns

A collection of tuples where the first element is a Point representing the end-point of a linear segment, and the second element is a Point containing the value of the tangent to the original Segment at that point.

7.134.2.4 GetLinearisationTangents()

```
abstract IEnumerable< Point > VectSharp.Segment.GetLinearisationTangents (
            Point?  previousPoint,
            double resolution )  [pure virtual]
```

Gets the tanget at the points at which the segment would be linearised.

Parameters

previousPoint	The point from which the Segment starts (i.e. the endpoint of the previous Segment).
resolution	The absolute length between successive samples in curve segments.

Returns

A collection of tangents at the points in which the segment would be linearised.

7.134.2.5 GetPointAt()

```
abstract Point VectSharp.Segment.GetPointAt (
            Point previousPoint,
            double position )  [pure virtual]
```

Gets the point on the Segment at the specified (relative) *position*).

Parameters

previousPoint	The point from which the Segment starts (i.e. the endpoint of the previous Segment).
position	The relative position on the Segment (0 is the start of the Segment, 1 is the end of the Segment).

Returns

The point at the specified position.

7.134.2.6 GetTangentAt()

```
abstract Point VectSharp.Segment.GetTangentAt (
            Point previousPoint,
            double position )  [pure virtual]
```

Gets the tangent to the Segment at the specified (relative) *position*).

Parameters

previousPoint	The point from which the Segment starts (i.e. the endpoint of the previous Segment).
position	The relative position on the Segment (0 is the start of the Segment, 1 is the end of the Segment).

Returns

The tangent to the point at the specified position.

7.134.2.7 Linearise()

```
abstract IEnumerable< Segment > VectSharp.Segment.Linearise (
            Point?  previousPoint,
            double resolution )  [pure virtual]
```

Transform the segment into a series of linear segments. Segments that are already linear are not changed.

Parameters

previousPoint	The point from which the Segment starts (i.e. the endpoint of the previous Segment).
resolution	The absolute length between successive samples in curve segments.

Returns

A collection of linear segments that approximate the current segment.

7.134.2.8 Measure()

```
abstract double VectSharp.Segment.Measure (
            Point previousPoint )  [pure virtual]
```

Computes the length of the Segment.

Parameters

previousPoint	The point from which the Segment starts (i.e. the endpoint of the previous Segment).

Returns

The length of the segment.

7.134.2.9 Transform()

```
abstract IEnumerable< Segment > VectSharp.Segment.Transform (
            Func< Point, Point > transformationFunction )  [pure virtual]
```

Applies an arbitrary transformation to all of the points of the Segment.

Parameters

transformationFunction	An arbitrary transformation function.

Returns

A collection of Segments that have been transformed according to the *transformationFunction* .

7.134.3 Property Documentation

7.134.3.1 Point

```
virtual Point VectSharp.Segment.Point  [get]
```

The end point of the Segment.

Definition at line 44 of file Segment.cs.

7.134.3.2 Points

```
Point [] VectSharp.Segment.Points  [get]
```

The points used to define the Segment.

Definition at line 39 of file Segment.cs.

7.134.3.3 Type

```
abstract SegmentType VectSharp.Segment.Type  [get]
```

The type of the Segment.

Definition at line 34 of file Segment.cs.

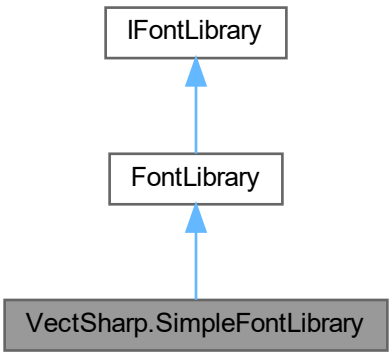
The documentation for this class was generated from the following file:

- VectSharp/Segment.cs

7.135 VectSharp.SimpleFontLibrary Class Reference

A font library that can be used to cache and resolve font family names.

Inheritance diagram for VectSharp.SimpleFontLibrary:



Public Member Functions

- SimpleFontLibrary (IFontLibrary standardFontLibrary)

  Create a new SimpleFontLibrary instance.
- SimpleFontLibrary ()

  Create a new SimpleFontLibrary instance, using the default font library to resolve the standard font families.
- SimpleFontLibrary (FontFamily timesRoman, FontFamily timesBold, FontFamily timesItalic, FontFamily timesBoldItalic, FontFamily helvetica, FontFamily helveticaBold, FontFamily helveticaOblique, FontFamily helveticaBoldOblique, FontFamily courier, FontFamily courierBold, FontFamily courierOblique, FontFamily courierBoldOblique, FontFamily symbol, FontFamily zapfdingbats)

  Create a new SimpleFontLibrary instance, with the specified replacements for the standard font families.
- SimpleFontLibrary (string timesRoman, string timesBold, string timesItalic, string timesBoldItalic, string helvetica, string helveticaBold, string helveticaOblique, string helveticaBoldOblique, string courier, string courierBold, string courierOblique, string courierBoldOblique, string symbol, string zapfdingbats)

  Create a new SimpleFontLibrary instance, with the specified replacements for the standard font families.
- void Add (string fontFamilyName, FontFamily fontFamily)

  Add the specified font family to the library with the specified name.
- void Add (FontFamily fontFamily)

  Add the specified font family to the library.
- void Add (string fileName)

  Add the font family contained in the specified True Type Font file to the library.
- void Add (string fontFamily, string fileName)

  Add the font family contained in the specified True Type Font file to the library, with the specified name. The font family is not loaded until it is requested for the first time.
- override FontFamily ResolveFontFamily (FontFamily.StandardFontFamilies standardFontFamily)

  Create a new font family from the specified standard font family name.

Parameters

standardFontFamily	*The standard name of the font family.*

Returns

A FontFamily object corresponding to the specified font family.

- override FontFamily ResolveFontFamily (string fontFamily)

  Create a new font family from the specified family name or true type file. If the family name or the true type file are not valid, an exception might be raised.

Parameters

fontFamily	*The name of the font family to create, or the path to a TTF file.*

Returns

If the font family name or the true type file is valid, a FontFamily object corresponding to the specified font family.

7.135.1 Detailed Description

A font library that can be used to cache and resolve font family names.

Definition at line 185 of file FontLibrary.cs.

7.135.2 Constructor & Destructor Documentation

7.135.2.1 SimpleFontLibrary() [1/4]

```
VectSharp.SimpleFontLibrary.SimpleFontLibrary (
            IFontLibrary standardFontLibrary )
```

Create a new SimpleFontLibrary instance.

Parameters

standardFontLibrary	An existing font library that will be used to resolve the standard font families.

Definition at line 197 of file FontLibrary.cs.

7.135.2.2 SimpleFontLibrary() [2/4]

```
VectSharp.SimpleFontLibrary.SimpleFontLibrary ( )
```

Create a new SimpleFontLibrary instance, using the default font library to resolve the standard font families.

Definition at line 217 of file FontLibrary.cs.

7.135.2.3 SimpleFontLibrary() [3/4]

```
VectSharp.SimpleFontLibrary.SimpleFontLibrary (
            FontFamily timesRoman,
            FontFamily timesBold,
            FontFamily timesItalic,
            FontFamily timesBoldItalic,
            FontFamily helvetica,
            FontFamily helveticaBold,
            FontFamily helveticaOblique,
            FontFamily helveticaBoldOblique,
            FontFamily courier,
            FontFamily courierBold,
            FontFamily courierOblique,
            FontFamily courierBoldOblique,
            FontFamily symbol,
            FontFamily zapfdingbats )
```

Create a new SimpleFontLibrary instance, with the specified replacements for the standard font families.

Parameters

timesRoman	The font family to use for the Times-Roman standard font.
timesBold	The font family to use for the Times-Bold standard font.
timesItalic	The font family to use for the Times-Italic standard font.
timesBoldItalic	The font family to use for the Times-BoldItalic standard font.
helvetica	The font family to use for the Helvetica standard font.

Parameters

helveticaBold	The font family to use for the Helvetica-Bold standard font.
helveticaOblique	The font family to use for the Helvetica-Oblique standard font.
helveticaBoldOblique	The font family to use for the Helvetica-BoldOblique standard font.
courier	The font family to use for the Courier standard font.
courierBold	The font family to use for the Courier-Bold standard font.
courierOblique	The font family to use for the Courier-Oblique standard font.
courierBoldOblique	The font family to use for the Courier-BoldOblique standard font.
symbol	The font family to use for the Symbol standard font.
zapfdingbats	The font family to use for the Zapfdingbats standard font.

Definition at line 239 of file FontLibrary.cs.

7.135.2.4 SimpleFontLibrary() [4/4]

```
VectSharp.SimpleFontLibrary.SimpleFontLibrary (
            string timesRoman,
            string timesBold,
            string timesItalic,
            string timesBoldItalic,
            string helvetica,
            string helveticaBold,
            string helveticaOblique,
            string helveticaBoldOblique,
            string courier,
            string courierBold,
            string courierOblique,
            string courierBoldOblique,
            string symbol,
            string zapfdingbats )
```

Create a new SimpleFontLibrary instance, with the specified replacements for the standard font families.

Parameters

timesRoman	The font family to use for the Times-Roman standard font.
timesBold	The font family to use for the Times-Bold standard font.
timesItalic	The font family to use for the Times-Italic standard font.
timesBoldItalic	The font family to use for the Times-BoldItalic standard font.
helvetica	The font family to use for the Helvetica standard font.
helveticaBold	The font family to use for the Helvetica-Bold standard font.
helveticaOblique	The font family to use for the Helvetica-Oblique standard font.
helveticaBoldOblique	The font family to use for the Helvetica-BoldOblique standard font.
courier	The font family to use for the Courier standard font.
courierBold	The font family to use for the Courier-Bold standard font.
courierOblique	The font family to use for the Courier-Oblique standard font.
courierBoldOblique	The font family to use for the Courier-BoldOblique standard font.
symbol	The font family to use for the Symbol standard font.
zapfdingbats	The font family to use for the Zapfdingbats standard font.

Definition at line 297 of file FontLibrary.cs.

7.135.3 Member Function Documentation

7.135.3.1 Add() [1/4]

```
void VectSharp.SimpleFontLibrary.Add (
            FontFamily fontFamily )
```

Add the specified font family to the library.

Parameters

fontFamily	The font family to add.

Definition at line 360 of file FontLibrary.cs.

7.135.3.2 Add() [2/4]

```
void VectSharp.SimpleFontLibrary.Add (
            string fileName )
```

Add the font family contained in the specified True Type Font file to the library.

Parameters

fileName	The path to the TTF file containing the font family.

Definition at line 372 of file FontLibrary.cs.

7.135.3.3 Add() [3/4]

```
void VectSharp.SimpleFontLibrary.Add (
            string fontFamily,
            string fileName )
```

Add the font family contained in the specified True Type Font file to the library, with the specified name. The font family is not loaded until it is requested for the first time.

Parameters

fontFamily	The name of the font family.
fileName	The path to the TTF file containing the font family.

Definition at line 387 of file FontLibrary.cs.

7.135.3.4 Add() [4/4]

```
void VectSharp.SimpleFontLibrary.Add (
            string fontFamilyName,
            FontFamily fontFamily )
```

Add the specified font family to the library with the specified name.

Parameters

fontFamilyName	The name of the font family.
fontFamily	The font family to add.

Definition at line 343 of file FontLibrary.cs.

7.135.3.5 ResolveFontFamily() [1/2]

```
override FontFamily VectSharp.SimpleFontLibrary.ResolveFontFamily (
            FontFamily.StandardFontFamilies standardFontFamily )  [virtual]
```

Create a new font family from the specified standard font family name.

Parameters

standardFontFamily	The standard name of the font family.

Returns

A FontFamily object corresponding to the specified font family.

Implements VectSharp.FontLibrary.

Definition at line 394 of file FontLibrary.cs.

7.135.3.6 ResolveFontFamily() [2/2]

```
override FontFamily VectSharp.SimpleFontLibrary.ResolveFontFamily (
            string fontFamily )  [virtual]
```

Create a new font family from the specified family name or true type file. If the family name or the true type file are not valid, an exception might be raised.

Parameters

fontFamily	The name of the font family to create, or the path to a TTF file.

Returns

If the font family name or the true type file is valid, a FontFamily object corresponding to the specified font family.

Implements VectSharp.FontLibrary.

Definition at line 400 of file FontLibrary.cs.

The documentation for this class was generated from the following file:

- VectSharp/FontLibrary.cs

7.136 VectSharp.Size Struct Reference

Represents the size of an object.

Public Member Functions

- Size (double width, double height)

  Create a new Size.

Public Attributes

- double Width

  Width of the object.
- double Height

  Height of the object.

7.136.1 Detailed Description

Represents the size of an object.

Definition at line 268 of file Point.cs.

7.136.2 Constructor & Destructor Documentation

7.136.2.1 Size()

```
VectSharp.Size.Size (
            double width,
            double height )
```

Create a new Size.

Parameters

width	The width of the object.
height	The height of the object.

Definition at line 285 of file Point.cs.

7.136.3 Member Data Documentation

7.136.3.1 Height

```
double VectSharp.Size.Height
```

Height of the object.

Definition at line 278 of file Point.cs.

7.136.3.2 Width

```
double VectSharp.Size.Width
```

Width of the object.

Definition at line 273 of file Point.cs.

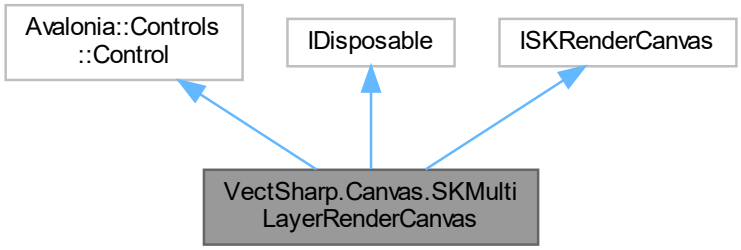
The documentation for this struct was generated from the following file:

- VectSharp/Point.cs

7.137 VectSharp.Canvas.SKMultiLayerRenderCanvas Class Reference

Represents a multi-threaded, triple-buffered canvas on which the image is drawn using SkiaSharp.

Inheritance diagram for VectSharp.Canvas.SKMultiLayerRenderCanvas:



Public Member Functions

- SKMultiLayerRenderCanvas (Document document, Colour backgroundColour, double width, double height, List< SKRenderAction > layerTransforms=null)

  Create a new SKMultiLayerRenderCanvas from a Document, where each page represents a layer.
- SKMultiLayerRenderCanvas (IEnumerable< Page > layers, Colour backgroundColour, double width, double height, List< SKRenderAction > layerTransforms=null)

  Create a new SKMultiLayerRenderCanvas from a collection of Pages, each representing a layer.
- SKMultiLayerRenderCanvas (List< SKRenderContext > contents, List< SKRenderAction > contentTransforms, Colour backgroundColour, double width, double height)

  Create a new SKMultiLayerRenderCanvas from a list of SKRenderContexts, each representing a layer.
- void UpdateWith (List< SKRenderContext > contents, List< SKRenderAction > contentTransforms, Colour backgroundColour, double width, double height)

  Replace the contents of the SKMultiLayerRenderCanvas with the specified layers.
- void UpdateLayer (int layer, SKRenderContext newContent, SKRenderAction newTransform)

  Replace a single layer with the specified content.
- void AddLayer (SKRenderContext newContent, SKRenderAction newTransform)

  Add a new layer to the image.
- void InsertLayer (int index, SKRenderContext newContent, SKRenderAction newTransform)

  Insert a new layer at the specified index.
- void RemoveLayer (int layer)

  Remove the specified layer from the image.
- void SwitchLayers (int layer1, int layer2)

  Switch the position of the two specified layers.
- void MoveLayer (int oldIndex, int newIndex)

  Move the specified layer to the specified position, shifting all other layers as necessary.
- RenderTargetBitmap RenderAtResolution (int width, int height, SKColor? background=null)

  Render the image to a bitmap at the specified resolution.
- void InvalidateDirty ()

  Invalidate the contents of the canvas, forcing it to redraw itself.
- void InvalidateZIndex ()

  Invalidate the contents of the canvas, specifying that the order of the layers has changed.
- override void Render (DrawingContext context)
- void Dispose ()

Public Attributes

- List< List< SKRenderAction > > RenderActions

  The list of render actions. Each element in this list is itself a list, containing the actions that correspond to a layer in the image.
- List< SKRenderAction > LayerTransforms

  The list of transforms associated with each layer.
- object RenderLock = new object()

  A lock for the rendering loop. The public methods of this class already lock on this, but you may need it if you want to directly manipulate the contents of the canvas.

Properties

- double PageWidth [get, set]

  The width of the page that is rendered on this canvas.
- double PageHeight [get, set]

  The height of the page that is rendered on this canvas.
- RelativePoint ClipMargin = new RelativePoint(0, 0, RelativeUnit.Absolute) [get, set]

  Defines an overdraw margin for the clipping area. Set this to a larger value if quickly moving the canvas around (e.g. in a ZoomBorder) causes the edge of the image to disappear for a few milliseconds and that annoys you. If RelativePoint.Unit is set to RelativeUnit.Absolute, the value corresponds to units on the VectSharp.Page; if it is set to RelativeUnit.Relative, it corresponds to a proportion of the visible area.

7.137.1 Detailed Description

Represents a multi-threaded, triple-buffered canvas on which the image is drawn using SkiaSharp.

Definition at line 39 of file SKMultiLayerRenderCanvas.cs.

7.137.2 Constructor & Destructor Documentation

7.137.2.1 SKMultiLayerRenderCanvas() [1/3]

```
VectSharp.Canvas.SKMultiLayerRenderCanvas.SKMultiLayerRenderCanvas (
            Document document,
            Colour backgroundColour,
            double width,
            double height,
            List< SKRenderAction > layerTransforms = null )
```

Create a new SKMultiLayerRenderCanvas from a Document, where each page represents a layer.

Parameters

document	The document containing the layers as Pages.
layerTransforms	A list of transforms associated with each layer. This list should contain the same number of elements as the number of pages in *document* . This is useful to manipulate the position of each layer individually. If this is null, an identity transform is applied to each layer.
backgroundColour	The background colour of the canvas.
width	The width of the canvas and the pages it contains.
height	The height of the canvas and the pages it contains.

Definition at line 82 of file SKMultiLayerRenderCanvas.cs.

7.137.2.2 SKMultiLayerRenderCanvas() [2/3]

```
VectSharp.Canvas.SKMultiLayerRenderCanvas.SKMultiLayerRenderCanvas (
            IEnumerable< Page > layers,
            Colour backgroundColour,
            double width,
            double height,
            List< SKRenderAction > layerTransforms = null )
```

Create a new SKMultiLayerRenderCanvas from a collection of Pages, each representing a layer.

Parameters

layers	The contents of the canvas. Each element in this list represents a layer.
layerTransforms	A list of transforms associated with each layer. This list should contain the same number of elements as *layers* . This is useful to manipulate the position of each layer individually. If this is null, an identity transform is applied to each layer.
backgroundColour	The background colour of the canvas.
width	The width of the canvas and the pages it contains.
height	The height of the canvas and the pages it contains.

Definition at line 92 of file SKMultiLayerRenderCanvas.cs.

7.137.2.3 SKMultiLayerRenderCanvas() [3/3]

```
VectSharp.Canvas.SKMultiLayerRenderCanvas.SKMultiLayerRenderCanvas (
            List< SKRenderContext > contents,
            List< SKRenderAction > contentTransforms,
            Colour backgroundColour,
            double width,
            double height )
```

Create a new SKMultiLayerRenderCanvas from a list of SKRenderContexts, each representing a layer.

Parameters

contents	The contents of the canvas. Each element in this list represents a layer. A Page can be converded to a SKRenderContext through the CopyToSKRenderContext method.
contentTransforms	A list of transforms associated with each layer. This list should contain the same number of elements as *contents* . This is useful to manipulate the position of each layer individually.
backgroundColour	The background colour of the canvas.
width	The width of the canvas and the page it contains.
height	The height of the canvas and the page it contains.

Definition at line 125 of file SKMultiLayerRenderCanvas.cs.

7.137.3 Member Function Documentation

7.137.3.1 AddLayer()

```
void VectSharp.Canvas.SKMultiLayerRenderCanvas.AddLayer (
            SKRenderContext newContent,
            SKRenderAction newTransform )
```

Add a new layer to the image.

Parameters

newContent	The contents of the new layer. A Page can be converded to a SKRenderContext through the CopyToSKRenderContext method.
newTransform	The transform for the new layer.

Definition at line 256 of file SKMultiLayerRenderCanvas.cs.

7.137.3.2 Dispose()

```
void VectSharp.Canvas.SKMultiLayerRenderCanvas.Dispose ( )
```

Definition at line 1134 of file SKMultiLayerRenderCanvas.cs.

7.137.3.3 InsertLayer()

```
void VectSharp.Canvas.SKMultiLayerRenderCanvas.InsertLayer (
            int index,
            SKRenderContext newContent,
            SKRenderAction newTransform )
```

Insert a new layer at the specified index.

Parameters

index	The position at which the new layer will be inserted.
newContent	The contents of the new layer.
newTransform	The transform for the new layer.

Definition at line 289 of file SKMultiLayerRenderCanvas.cs.

7.137.3.4 InvalidateDirty()

```
void VectSharp.Canvas.SKMultiLayerRenderCanvas.InvalidateDirty ( )
```

Invalidate the contents of the canvas, forcing it to redraw itself.

Definition at line 943 of file SKMultiLayerRenderCanvas.cs.

7.137.3.5 InvalidateZIndex()

```
void VectSharp.Canvas.SKMultiLayerRenderCanvas.InvalidateZIndex ( )
```

Invalidate the contents of the canvas, specifying that the order of the layers has changed.

Definition at line 952 of file SKMultiLayerRenderCanvas.cs.

7.137.3.6 MoveLayer()

```
void VectSharp.Canvas.SKMultiLayerRenderCanvas.MoveLayer (
            int oldIndex,
            int newIndex )
```

Move the specified layer to the specified position, shifting all other layers as necessary.

Parameters

oldIndex	The current index of the layer to move.
newIndex	The final index of the layer. Layers after this will be shifted by 1 in order to accommodate the moved layer.

Definition at line 369 of file SKMultiLayerRenderCanvas.cs.

7.137.3.7 RemoveLayer()

```
void VectSharp.Canvas.SKMultiLayerRenderCanvas.RemoveLayer (
            int layer )
```

Remove the specified layer from the image.

Parameters

layer	The index of the layer to remove.

Definition at line 320 of file SKMultiLayerRenderCanvas.cs.

7.137.3.8 Render()

```
override void VectSharp.Canvas.SKMultiLayerRenderCanvas.Render (
            DrawingContext context )
```

Definition at line 977 of file SKMultiLayerRenderCanvas.cs.

7.137.3.9 RenderAtResolution()

```
RenderTargetBitmap VectSharp.Canvas.SKMultiLayerRenderCanvas.RenderAtResolution (
            int width,
            int height,
            SKColor?  background = null )
```

Render the image to a bitmap at the specified resolution.

Parameters

width	The width of the rendered image. Note that the actual width of the returned image might be lower than this, depending on the aspect ratio of the image.
height	The height of the rendered image. Note that the actual height of the returned image might be lower than this, depending on the aspect ratio of the image.
background	The background colour for the image. If this is `null`, the current background colour is used.

Returns

A RenderTargetBitmap containing the image rendered at the specified resolution.

Definition at line 705 of file SKMultiLayerRenderCanvas.cs.

7.137.3.10 SwitchLayers()

```
void VectSharp.Canvas.SKMultiLayerRenderCanvas.SwitchLayers (
            int layer1,
            int layer2 )
```

Switch the position of the two specified layers.

Parameters

layer1	The index of the first layer to switch.
layer2	The index of the second layer to switch.

Definition at line 344 of file SKMultiLayerRenderCanvas.cs.

7.137.3.11 UpdateLayer()

```
void VectSharp.Canvas.SKMultiLayerRenderCanvas.UpdateLayer (
            int layer,
            SKRenderContext newContent,
            SKRenderAction newTransform )
```

Replace a single layer with the specified content.

Parameters

layer	The index of the layer to replace.
newContent	The new contents of the layer. A Page can be converded to a SKRenderContext through the CopyToSKRenderContext method.
newTransform	The new transform for the layer.

Definition at line 224 of file SKMultiLayerRenderCanvas.cs.

7.137.3.12 UpdateWith()

```
void VectSharp.Canvas.SKMultiLayerRenderCanvas.UpdateWith (
            List< SKRenderContext > contents,
            List< SKRenderAction > contentTransforms,
            Colour backgroundColour,
            double width,
            double height )
```

Replace the contents of the SKMultiLayerRenderCanvas with the specified layers.

Parameters

contents	The contents of the canvas. Each element in this list represents a layer. A Page can be converded to a SKRenderContext through the CopyToSKRenderContext method.
contentTransforms	A list of transforms associated with each layer. This list should contain the same number of elements as *contents* . This is useful to manipulate the position of each layer individually.
backgroundColour	The background colour of the canvas.
width	The width of the canvas and the page it contains.
height	The height of the canvas and the page it contains.

Definition at line 146 of file SKMultiLayerRenderCanvas.cs.

7.137.4 Member Data Documentation

7.137.4.1 LayerTransforms

```
List<SKRenderAction> VectSharp.Canvas.SKMultiLayerRenderCanvas.LayerTransforms
```

The list of transforms associated with each layer.

Definition at line 69 of file SKMultiLayerRenderCanvas.cs.

7.137.4.2 RenderActions

```
List<List<SKRenderAction> > VectSharp.Canvas.SKMultiLayerRenderCanvas.RenderActions
```

The list of render actions. Each element in this list is itself a list, containing the actions that correspond to a layer in the image.

Definition at line 64 of file SKMultiLayerRenderCanvas.cs.

7.137.4.3 RenderLock

```
object VectSharp.Canvas.SKMultiLayerRenderCanvas.RenderLock = new object()
```

A lock for the rendering loop. The public methods of this class already lock on this, but you may need it if you want to directly manipulate the contents of the canvas.

Definition at line 696 of file SKMultiLayerRenderCanvas.cs.

7.137.5 Property Documentation

7.137.5.1 ClipMargin

```
RelativePoint VectSharp.Canvas.SKMultiLayerRenderCanvas.ClipMargin = new RelativePoint(0, 0,
RelativeUnit.Absolute)  [get], [set]
```

Defines an overdraw margin for the clipping area. Set this to a larger value if quickly moving the canvas around (e.g. in a ZoomBorder) causes the edge of the image to disappear for a few milliseconds and that annoys you. If RelativePoint.Unit is set to RelativeUnit.Absolute, the value corresponds to units on the VectSharp.Page; if it is set to RelativeUnit.Relative, it corresponds to a proportion of the visible area.

Definition at line 59 of file SKMultiLayerRenderCanvas.cs.

7.137.5.2 PageHeight

```
double VectSharp.Canvas.SKMultiLayerRenderCanvas.PageHeight  [get], [set]
```

The height of the page that is rendered on this canvas.

Definition at line 49 of file SKMultiLayerRenderCanvas.cs.

7.137.5.3 PageWidth

```
double VectSharp.Canvas.SKMultiLayerRenderCanvas.PageWidth  [get], [set]
```

The width of the page that is rendered on this canvas.

Definition at line 44 of file SKMultiLayerRenderCanvas.cs.

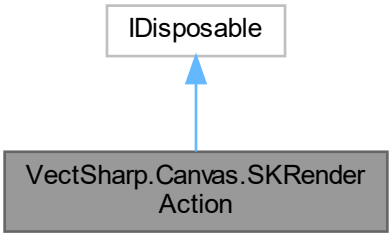
The documentation for this class was generated from the following file:

- VectSharp.Canvas/SKMultiLayerRenderCanvas.cs

7.138 VectSharp.Canvas.SKRenderAction Class Reference

Represents a light-weight rendering action.

Inheritance diagram for VectSharp.Canvas.SKRenderAction:



Public Types

- enum ActionTypes

  Types of rendering actions.

Public Member Functions

- void InvalidateHitTestPath ()
- void InvalidateVisual ()
- void InvalidateZIndex ()
- void InvalidateAll ()
- void Dispose ()

Static Public Member Functions

- static SKRenderAction PathAction (SKPath path, SKPaint paint, string tag=null)

  Creates a new SKRenderAction representing a path.
- static SKRenderAction ClipAction (SKPath clippingPath, string tag=null)

  Creates a new SKRenderAction representing a clipping action.
- static SKRenderAction TextAction (string text, float x, float y, SKFont font, SKPaint paint, string tag=null)

  Creates a new SKRenderAction representing text.
- static SKRenderAction ImageAction (string imageId, SKRect sourceRect, SKRect destinationRect, string tag=null)

  Creates a new SKRenderAction representing an image.
- static SKRenderAction TransformAction (SKMatrix transform, string tag=null)

  Creates a new SKRenderAction representing a transform.
- static SKRenderAction SaveAction (string tag=null)

  Creates a new SKRenderAction that saves the current graphics state.
- static SKRenderAction RestoreAction (string tag=null)

  Creates a new SKRenderAction that saves the current graphics state.
- static SKRenderAction DrawFilteredGraphicsAction (SKRenderContext graphics, IFilter filter, string tag=null)

  Create a new SKRenderAction that draws some graphics with a filter.

Properties

- bool Disposed `[get]`

  Returns a boolean value indicating whether the current instance has been disposed.
- ActionTypes ActionType `[get]`

  Type of the rendering action.
- SKPath Path `[get, set]`

  Path that needs to be rendered (null if the action type is not ActionTypes.Path). If you change this, you probably want to call this object's InvalidateHitTestPath method.
- string Text `[get, set]`

  Text that needs to be rendered (null if the action type is not ActionTypes.Text). If you change this, you probably want to call this object's InvalidateHitTestPath method.
- SKFont Font `[get, set]`

  The font that will be used to render the text (null if the action type is not ActionTypes.Text). If you change this, you probably want to call this object's InvalidateHitTestPath method.
- float TextX `[get, set]`

  The X coordainate at which the text will be drawn (null if the action type is not ActionTypes.Text). If you change this, you probably want to call this object's InvalidateHitTestPath method.
- float TextY `[get, set]`

  The Y coordainate at which the text will be drawn (null if the action type is not ActionTypes.Text). If you change this, you probably want to call this object's InvalidateHitTestPath method.
- SKPaint Paint `[get, set]`

Paint used to render the text or path (`null` if the action type is neither ActionTypes.Text nor ActionTypes.Path). If you change this, you probably want to call this object's InvalidateHitTestPath method.

- string ImageId `[get, set]`

  Univocal identifier of the image that needs to be drawn.

- SKRect? ImageSource `[get, set]`

  The source rectangle of the image (`null` if the action type is not ActionTypes.RasterImage). If you change this, you probably want to call this object's InvalidateVisual method.

- SKRect? ImageDestination `[get, set]`

  The destination rectangle of the image (`null` if the action type is not ActionTypes.RasterImage). If you change this, you probably want to call this object's InvalidateHitTestPath method.

- SKMatrix? Transform = null `[get, set]`

  The transformation matrix that will be applied to the current coordinate system (`null` if the action type is not ActionTypes.Transform). If you change this, you probably want to call this object's InvalidateVisual method.

- string Tag `[get]`

  A tag to access the SKRenderAction.

- uint ZIndex = 0 `[get, set]`

  The Z-index of the rendering action (an action with a higher Z-index will always appear above an action with a lower Z-index). The more different values there are for the Z-index, the slower the rendering, so keep use of this property to a minimum. If you change this, you probably want to call this object's InvalidateZIndex method.

- SKRenderContext Graphics = null `[get, set]`

  The graphics that will be drawn with the specified Filter. If you change this, you probably want to call this object's InvalidateVisual method.

- IFilter Filter `[get, set]`

  The filter with which the Graphics is drawn. If you change this, you probably want to call this object's InvalidateVisual method.

- object Payload `[get, set]`

  An arbitrary object associated with the RenderAction.

- Avalonia.Controls.Canvas Parent `[get]`

  The container of this SKRenderAction.

Events

- EventHandler< Avalonia.Input.PointerEventArgs > PointerEntered

  Raised when the pointer enters the area covered by the SKRenderAction.

- EventHandler< Avalonia.Input.PointerEventArgs > PointerExited

  Raised when the pointer leaves the area covered by the SKRenderAction.

- EventHandler< Avalonia.Input.PointerPressedEventArgs > PointerPressed

  Raised when the pointer is pressed while over the area covered by the SKRenderAction.

- EventHandler< Avalonia.Input.PointerReleasedEventArgs > PointerReleased

  Raised when the pointer is released after a PointerPressed event.

7.138.1 Detailed Description

Represents a light-weight rendering action.

Definition at line 30 of file SKRenderContext.cs.

7.138.2 Member Enumeration Documentation

7.138.2.1 ActionTypes

```
enum VectSharp.Canvas.SKRenderAction.ActionTypes
```

Types of rendering actions.

Definition at line 42 of file SKRenderContext.cs.

7.138.3 Member Function Documentation

7.138.3.1 ClipAction()

```
static SKRenderAction VectSharp.Canvas.SKRenderAction.ClipAction (
            SKPath clippingPath,
            string tag = null )  [static]
```

Creates a new SKRenderAction representing a clipping action.

Parameters

clippingPath	The path to be used for clipping.
tag	A tag to access the SKRenderAction.

Returns

A new SKRenderAction representing a clipping action.

Definition at line 345 of file SKRenderContext.cs.

7.138.3.2 Dispose()

```
void VectSharp.Canvas.SKRenderAction.Dispose ( )
```

Definition at line 494 of file SKRenderContext.cs.

7.138.3.3 DrawFilteredGraphicsAction()

```
static SKRenderAction VectSharp.Canvas.SKRenderAction.DrawFilteredGraphicsAction (
            SKRenderContext graphics,
            IFilter filter,
            string tag = null )  [static]
```

Create a new SKRenderAction that draws some graphics with a filter.

Returns

A new SKRenderAction that draws some graphics with a filter.

Definition at line 464 of file SKRenderContext.cs.

7.138.3.4 ImageAction()

```
static SKRenderAction VectSharp.Canvas.SKRenderAction.ImageAction (
            string imageId,
            SKRect sourceRect,
            SKRect destinationRect,
            string tag = null )  [static]
```

Creates a new SKRenderAction representing an image.

Parameters

imageId	The univocal identifier of the image to draw.
sourceRect	The source rectangle of the image.
destinationRect	The destination rectangle of the image.
tag	A tag to access the SKRenderAction. If this is null this SKRenderAction is not visible in the hit test.

Returns

A new SKRenderAction representing an image.

Definition at line 397 of file SKRenderContext.cs.

7.138.3.5 InvalidateAll()

```
void VectSharp.Canvas.SKRenderAction.InvalidateAll ( )
```

This methods signals to the Parent that the Z-index, shape and visual properties (e.g. the colour) of this object have changed and triggers a redraw.

If you make changes to more than one SKRenderAction contained in the same Canvas, you only need to invalidate the last one.

This method should only be called after the output has been fully initialized.

Definition at line 303 of file SKRenderContext.cs.

7.138.3.6 InvalidateHitTestPath()

```
void VectSharp.Canvas.SKRenderAction.InvalidateHitTestPath ( )
```

Signals to this object that its shape has changed and a new path needs to be computed for the purpose of hit-testing. Also signals to the Parent that the visual properties of this object have changed and triggers a redraw.

This method should be called whenever the "shape" of the object represented by the SKRenderAction changes. If only the visual properties of this object have changed (e.g. the colour), call the InvalidateVisual method instead.

If you make changes to more than one SKRenderAction contained in the same SKMultiLayerRenderCanvas, you only need to invalidate the last one.

This method should only be called after the output has been fully initialized.

Definition at line 232 of file SKRenderContext.cs.

7.138.3.7 InvalidateVisual()

```
void VectSharp.Canvas.SKRenderAction.InvalidateVisual ( )
```

This methods signals to the Parent that the visual properties (e.g. the colour) of this object have changed and triggers a redraw.

If the "shape" of the object has changed as well, call the InvalidateHitTestPath method instead. If the Z-index of the object has changed, call the InvalidateZIndex method instead. If both the "shape" and the Z-index of the object have changed, call the InvalidateAll method.

If you make changes to more than one SKRenderAction contained in the same Canvas, you only need to invalidate the last one.

This method should only be called after the output has been fully initialized.

Definition at line 282 of file SKRenderContext.cs.

7.138.3.8 InvalidateZIndex()

```
void VectSharp.Canvas.SKRenderAction.InvalidateZIndex ( )
```

This methods signals to the Parent that the Z-index and visual properties (e.g. the colour) of this object have changed and triggers a redraw.

If the "shape" of the object has changed as well, call the InvalidateAll method instead.

If you make changes to more than one SKRenderAction contained in the same Canvas, you only need to invalidate the last one.

This method should only be called after the output has been fully initialized.

Definition at line 293 of file SKRenderContext.cs.

7.138.3.9 PathAction()

```
static SKRenderAction VectSharp.Canvas.SKRenderAction.PathAction (
            SKPath path,
            SKPaint paint,
            string tag = null )  [static]
```

Creates a new SKRenderAction representing a path.

Parameters

path	The geometry to be rendered.
paint	The paint used to fill or stroke the path.
tag	A tag to access the SKRenderAction. If this is null this SKRenderAction is not visible in the hit test.

Returns

A new SKRenderAction representing a path.

Definition at line 321 of file SKRenderContext.cs.

7.138.3.10 RestoreAction()

```
static SKRenderAction VectSharp.Canvas.SKRenderAction.RestoreAction (
            string tag = null )  [static]
```

Creates a new SKRenderAction that saves the current graphics state.

Parameters

tag	A tag to access the SKRenderAction.

Returns

A new SKRenderAction that restores the last saved graphics state.

Definition at line 451 of file SKRenderContext.cs.

7.138.3.11 SaveAction()

```
static SKRenderAction VectSharp.Canvas.SKRenderAction.SaveAction (
            string tag = null )  [static]
```

Creates a new SKRenderAction that saves the current graphics state.

Parameters

tag	A tag to access the SKRenderAction.

Returns

A new SKRenderAction that saves the current graphics state.

Definition at line 437 of file SKRenderContext.cs.

7.138.3.12 TextAction()

```
static SKRenderAction VectSharp.Canvas.SKRenderAction.TextAction (
            string text,
```

```
            float x,
            float y,
            SKFont font,
            SKPaint paint,
            string tag = null )  [static]
```

Creates a new SKRenderAction representing text.

Parameters

text	The text to be rendered.
x	The X coordinate at which the text will be drawn.
y	The Y coordinate at which the text will be drawn.
font	The font to be used to render the text.
paint	The paint to be used to fill or stroke the text.
tag	A tag to access the SKRenderAction. If this is null this SKRenderAction is not visible in the hit test.

Returns

A new SKRenderAction representing text.

Definition at line 365 of file SKRenderContext.cs.

7.138.3.13 TransformAction()

```
static SKRenderAction VectSharp.Canvas.SKRenderAction.TransformAction (
            SKMatrix transform,
            string tag = null )  [static]
```

Creates a new SKRenderAction representing a transform.

Parameters

transform	The transform to apply.
tag	A tag to access the SKRenderAction.

Returns

A new SKRenderAction representing a transform.

Definition at line 422 of file SKRenderContext.cs.

7.138.4 Property Documentation

7.138.4.1 ActionType

```
ActionTypes VectSharp.Canvas.SKRenderAction.ActionType [get]
```

Type of the rendering action.

Definition at line 88 of file SKRenderContext.cs.

7.138.4.2 Disposed

```
bool VectSharp.Canvas.SKRenderAction.Disposed [get]
```

Returns a boolean value indicating whether the current instance has been disposed.

Definition at line 35 of file SKRenderContext.cs.

7.138.4.3 Filter

```
IFilter VectSharp.Canvas.SKRenderAction.Filter [get], [set]
```

The filter with which the Graphics is drawn. If you change this, you probably want to call this object's InvalidateVisual method.

Definition at line 163 of file SKRenderContext.cs.

7.138.4.4 Font

```
SKFont VectSharp.Canvas.SKRenderAction.Font [get], [set]
```

The font that will be used to render the text (null if the action type is not ActionTypes.Text). If you change this, you probably want to call this object's InvalidateHitTestPath method.

Definition at line 106 of file SKRenderContext.cs.

7.138.4.5 Graphics

```
SKRenderContext VectSharp.Canvas.SKRenderAction.Graphics = null [get], [set]
```

The graphics that will be drawn with the specified Filter. If you change this, you probably want to call this object's InvalidateVisual method.

Definition at line 158 of file SKRenderContext.cs.

7.138.4.6 ImageDestination

```
SKRect?  VectSharp.Canvas.SKRenderAction.ImageDestination  [get], [set]
```

The destination rectangle of the image (`null` if the action type is not ActionTypes.RasterImage). If you change this, you probably want to call this object's InvalidateHitTestPath method.

Definition at line 136 of file SKRenderContext.cs.

7.138.4.7 ImageId

```
string VectSharp.Canvas.SKRenderAction.ImageId  [get], [set]
```

Univocal identifier of the image that needs to be drawn.

Definition at line 126 of file SKRenderContext.cs.

7.138.4.8 ImageSource

```
SKRect?  VectSharp.Canvas.SKRenderAction.ImageSource  [get], [set]
```

The source rectangle of the image (`null` if the action type is not ActionTypes.RasterImage). If you change this, you probably want to call this object's InvalidateVisual method.

Definition at line 131 of file SKRenderContext.cs.

7.138.4.9 Paint

```
SKPaint VectSharp.Canvas.SKRenderAction.Paint  [get], [set]
```

Paint used to render the text or path (`null` if the action type is neither ActionTypes.Text nor ActionTypes.Path). If you change this, you probably want to call this object's InvalidateHitTestPath method.

Definition at line 121 of file SKRenderContext.cs.

7.138.4.10 Parent

```
Avalonia.Controls.Canvas VectSharp.Canvas.SKRenderAction.Parent  [get]
```

The container of this SKRenderAction.

Definition at line 175 of file SKRenderContext.cs.

7.138.4.11 Path

```
SKPath VectSharp.Canvas.SKRenderAction.Path  [get], [set]
```

Path that needs to be rendered (null if the action type is not ActionTypes.Path). If you change this, you probably want to call this object's InvalidateHitTestPath method.

Definition at line 93 of file SKRenderContext.cs.

7.138.4.12 Payload

```
object VectSharp.Canvas.SKRenderAction.Payload  [get], [set]
```

An arbitrary object associated with the RenderAction.

Definition at line 168 of file SKRenderContext.cs.

7.138.4.13 Tag

```
string VectSharp.Canvas.SKRenderAction.Tag  [get]
```

A tag to access the SKRenderAction.

Definition at line 146 of file SKRenderContext.cs.

7.138.4.14 Text

```
string VectSharp.Canvas.SKRenderAction.Text  [get], [set]
```

Text that needs to be rendered (null if the action type is not ActionTypes.Text). If you change this, you probably want to call this object's InvalidateHitTestPath method.

Definition at line 101 of file SKRenderContext.cs.

7.138.4.15 TextX

```
float VectSharp.Canvas.SKRenderAction.TextX  [get], [set]
```

The X coordainate at which the text will be drawn (null if the action type is not ActionTypes.Text). If you change this, you probably want to call this object's InvalidateHitTestPath method.

Definition at line 111 of file SKRenderContext.cs.

7.138.4.16 TextY

```
float VectSharp.Canvas.SKRenderAction.TextY  [get], [set]
```

The Y coordainate at which the text will be drawn (null if the action type is not ActionTypes.Text). If you change this, you probably want to call this object's InvalidateHitTestPath method.

Definition at line 116 of file SKRenderContext.cs.

7.138.4.17 Transform

```
SKMatrix?  VectSharp.Canvas.SKRenderAction.Transform = null  [get], [set]
```

The transformation matrix that will be applied to the current coordinate system (`null` if the action type is not ActionTypes.Transform). If you change this, you probably want to call this object's InvalidateVisual method.

Definition at line 141 of file SKRenderContext.cs.

7.138.4.18 ZIndex

```
uint VectSharp.Canvas.SKRenderAction.ZIndex = 0  [get], [set]
```

The Z-index of the rendering action (an action with a higher Z-index will always appear above an action with a lower Z-index). The more different values there are for the Z-index, the slower the rendering, so keep use of this property to a minimum. If you change this, you probably want to call this object's InvalidateZIndex method.

Definition at line 153 of file SKRenderContext.cs.

7.138.5 Event Documentation

7.138.5.1 PointerEntered

```
EventHandler<Avalonia.Input.PointerEventArgs> VectSharp.Canvas.SKRenderAction.PointerEntered
```

Raised when the pointer enters the area covered by the SKRenderAction.

Definition at line 186 of file SKRenderContext.cs.

7.138.5.2 PointerExited

```
EventHandler<Avalonia.Input.PointerEventArgs> VectSharp.Canvas.SKRenderAction.PointerExited
```

Raised when the pointer leaves the area covered by the SKRenderAction.

Definition at line 191 of file SKRenderContext.cs.

7.138.5.3 PointerPressed

```
EventHandler<Avalonia.Input.PointerPressedEventArgs> VectSharp.Canvas.SKRenderAction.Pointer↩
Pressed
```

Raised when the pointer is pressed while over the area covered by the SKRenderAction.

Definition at line 196 of file SKRenderContext.cs.

7.138.5.4 PointerReleased

```
EventHandler<Avalonia.Input.PointerReleasedEventArgs> VectSharp.Canvas.SKRenderAction.Pointer↩
Released
```

Raised when the pointer is released after a PointerPressed event.

Definition at line 201 of file SKRenderContext.cs.

The documentation for this class was generated from the following file:

- VectSharp.Canvas/SKRenderContext.cs

7.139 VectSharp.Canvas.SKRenderContext Class Reference

Represents a page that has been prepared for fast rendering using the SkiaSharp renderer.

7.139.1 Detailed Description

Represents a page that has been prepared for fast rendering using the SkiaSharp renderer.

Definition at line 546 of file SKRenderContext.cs.

The documentation for this class was generated from the following file:

- VectSharp.Canvas/SKRenderContext.cs

7.140 VectSharp.Canvas.SKRenderContextInterpreter Class Reference

Contains methods to render a Page to an Avalonia.Controls.Canvas using the SkiaSharp renderer.

Static Public Member Functions

- static SKMultiLayerRenderCanvas PaintToSKCanvas (this Document document, double? width=null, double? height=null, Colour? background=null, AvaloniaContextInterpreter.TextOptions textOption=AvaloniaContextInterpreter.TextOptions.ConvertIfNecessary, FilterOption filterOption=default)

  Render a Document to an Avalonia.Controls.Canvas using the SkiaSharp renderer. Each page corresponds to a layer in the image.
- static SKMultiLayerRenderCanvas PaintToSKCanvas (this Document document, Dictionary< string, Func< SKRenderAction, IEnumerable< SKRenderAction > > > taggedActions, bool removeTaggedActionsAfterExecution=true, double? width=null, double? height=null, Colour? background=null, AvaloniaContextInterpreter.TextOptions textOption=AvaloniaContextInterpreter.TextOptions.ConvertIfNecessary, FilterOption filterOption=default)

  Render a Document to an Avalonia.Controls.Canvas using the SkiaSharp renderer. Each page corresponds to a layer in the image.
- static SKMultiLayerRenderCanvas PaintToSKCanvas (this Document document, Dictionary< string, Func< SKRenderAction, IEnumerable< SKRenderAction > > > taggedActions, Dictionary< string,(SKBitmap, bool)> images, bool removeTaggedActionsAfterExecution=true, double? width=null, double? height=null, Colour? background=null, AvaloniaContextInterpreter.TextOptions textOption=AvaloniaContextInterpreter.TextOptions.ConvertIfNecessary, FilterOption filterOption=default)

  Render a Document to an Avalonia.Controls.Canvas using the SkiaSharp renderer. Each page corresponds to a layer in the image.
- static SKMultiLayerRenderCanvas PaintToSKCanvas (this Page page, AvaloniaContextInterpreter.TextOptions textOption=AvaloniaContextInterpreter.TextOptions.ConvertIfNecessary, FilterOption filterOption=default)

  Render a Page to an Avalonia.Controls.Canvas using the SkiaSharp renderer.
- static SKMultiLayerRenderCanvas PaintToSKCanvas (this Page page, Dictionary< string, Func< SKRenderAction, IEnumerable< SKRenderAction > > > taggedActions, bool removeTaggedActionsAfterExecution=true, AvaloniaContextInterpreter.TextOptions textOption=AvaloniaContextInterpreter.TextOptions.ConvertIfNecessary, FilterOption filterOption=default)

  Render a Page to an Avalonia.Controls.Canvas using the SkiaSharpRenderer.
- static SKMultiLayerRenderCanvas PaintToSKCanvas (this Page page, Dictionary< string, Func< SKRenderAction, IEnumerable< SKRenderAction > > > taggedActions, Dictionary< string,(SKBitmap, bool)> images, bool removeTaggedActionsAfterExecution=true, AvaloniaContextInterpreter.TextOptions textOption=AvaloniaContextInterpreter.TextOptions.ConvertIfNecessary, FilterOption filterOption=default)

  Render a Page to an Avalonia.Controls.Canvas using the SkiaSharpRenderer.
- static SKRenderContext CopyToSKRenderContext (this Page page, AvaloniaContextInterpreter.TextOptions textOption=AvaloniaContextInterpreter.TextOptions.ConvertIfNecessary, FilterOption filterOption=default)

  Render a Page to a SKRenderContext. This can be drawn using the SkiaSharpRenderer by adding it to a SKMultiLayerRenderCanvas.
- static SKRenderContext CopyToSKRenderContext (this Page page, Dictionary< string, Func< SKRenderAction, IEnumerable< SKRenderAction > > > taggedActions, bool removeTaggedActionsAfterExecution=true, AvaloniaContextInterpreter.TextOptions textOption=AvaloniaContextInterpreter.TextOptions.ConvertIfNecessary, FilterOption filterOption=default)

  Render a Page to a SKRenderContext. This can be drawn using the SkiaSharpRenderer by adding it to a SKMultiLayerRenderCanvas.
- static SKRenderContext CopyToSKRenderContext (this Page page, Dictionary< string, Func< SKRenderAction, IEnumerable< SKRenderAction > > > taggedActions, Dictionary< string,(SKBitmap, bool)> images, bool removeTaggedActionsAfterExecution=true, AvaloniaContextInterpreter.TextOptions textOption=AvaloniaContextInterpreter.TextOptions.ConvertIfNecessary, FilterOption filterOption=default)

  Render a Page to a SKRenderContext. This can be drawn using the SkiaSharpRenderer by adding it to a SKMultiLayerRenderCanvas.
- static RasterImage Rasterise (this Graphics graphics, Rectangle region, double scale, bool interpolate)

  Rasterise a region of a Graphics object.

7.140.1 Detailed Description

Contains methods to render a Page to an Avalonia.Controls.Canvas using the SkiaSharp renderer.

Definition at line 1545 of file SKRenderContext.cs.

7.140.2 Member Function Documentation

7.140.2.1 CopyToSKRenderContext() [1/3]

```
static SKRenderContext VectSharp.Canvas.SKRenderContextInterpreter.CopyToSKRenderContext (
            this Page page,
            AvaloniaContextInterpreter.TextOptions textOption = AvaloniaContextInterpreter.TextOptions.Conver
            FilterOption filterOption = default )  [static]
```

Render a Page to a SKRenderContext. This can be drawn using the SkiaSharpRenderer by adding it to a SKMultiLayerRenderCanvas.

Parameters

page	The Page to render.
textOption	Defines whether text items should be converted into paths when drawing.
filterOption	Defines how and whether image filters should be rasterised when rendering the image.

Returns

A SKRenderContext containing the rendered graphics objects.

Definition at line 1678 of file SKRenderContext.cs.

7.140.2.2 CopyToSKRenderContext() [2/3]

```
static SKRenderContext VectSharp.Canvas.SKRenderContextInterpreter.CopyToSKRenderContext (
            this Page page,
            Dictionary< string, Func< SKRenderAction, IEnumerable< SKRenderAction > > >
taggedActions,
            bool removeTaggedActionsAfterExecution = true,
            AvaloniaContextInterpreter.TextOptions textOption = AvaloniaContextInterpreter.TextOptions.Conver
            FilterOption filterOption = default )  [static]
```

Render a Page to a SKRenderContext. This can be drawn using the SkiaSharpRenderer by adding it to a SKMultiLayerRenderCanvas.

Parameters

page	The Page to render.
taggedActions	A Dictionary containing the actions that will be performed on items with the corresponding tag. These should be functions that accept one parameter of type SKRenderAction and return an IEnumerable<SKRenderAction> of the render actions that will actually be added to the plot.
removeTaggedActionsAfterExecution	Whether the actions should be removed from *taggedActions* after their execution. Set to false if the same action should be performed on multiple items with the same tag.
textOption	Defines whether text items should be converted into paths when drawing.
filterOption	Defines how and whether image filters should be rasterised when rendering the image.

Returns

A SKRenderContext containing the rendered graphics objects.

Definition at line 1695 of file SKRenderContext.cs.

7.140.2.3 CopyToSKRenderContext() [3/3]

```
static SKRenderContext VectSharp.Canvas.SKRenderContextInterpreter.CopyToSKRenderContext (
            this Page page,
            Dictionary< string, Func< SKRenderAction, IEnumerable< SKRenderAction > > >
taggedActions,
            Dictionary< string,(SKBitmap, bool)> images,
            bool removeTaggedActionsAfterExecution = true,
            AvaloniaContextInterpreter.TextOptions textOption = AvaloniaContextInterpreter.TextOptions.Conver
            FilterOption filterOption = default )  [static]
```

Render a Page to a SKRenderContext. This can be drawn using the SkiaSharpRenderer by adding it to a SKMultiLayerRenderCanvas.

Parameters

page	The Page to render.
taggedActions	A Dictionary containing the actions that will be performed on items with the corresponding tag. These should be functions that accept one parameter of type SKRenderAction and return an IEnumerable<SKRenderAction> of the render actions that will actually be added to the plot.
images	A dictionary that associates to each raster image path (or data URL) the image rendered as a SKBitmap and a boolean value indicating whether it should be drawn as "pixelated" or not. This will be populated automatically as the page is rendered. If you are rendering multiple Pages (or you are rendering the same page multiple times), it will be beneficial to keep a reference to this dictionary and pass it again on further rendering requests; otherwise, you can just pass an empty dictionary.

Parameters

removeTaggedActionsAfterExecution	Whether the actions should be removed from *taggedActions* after their execution. Set to false if the same action should be performed on multiple items with the same tag.
textOption	Defines whether text items should be converted into paths when drawing.
filterOption	Defines how and whether image filters should be rasterised when rendering the image.

Returns

A SKRenderContext containing the rendered graphics objects.

Definition at line 1714 of file SKRenderContext.cs.

7.140.2.4 PaintToSKCanvas() [1/6]

```
static SKMultiLayerRenderCanvas VectSharp.Canvas.SKRenderContextInterpreter.PaintToSKCanvas (
            this Document document,
            Dictionary< string, Func< SKRenderAction, IEnumerable< SKRenderAction > > >
taggedActions,
            bool removeTaggedActionsAfterExecution = true,
            double?  width = null,
            double?  height = null,
            Colour?  background = null,
            AvaloniaContextInterpreter.TextOptions textOption = AvaloniaContextInterpreter.TextOptions.Conver
            FilterOption filterOption = default )  [static]
```

Render a Document to an Avalonia.Controls.Canvas using the SkiaSharp renderer. Each page corresponds to a layer in the image.

Parameters

document	The Document to render.
taggedActions	A Dictionary containing the actions that will be performed on items with the corresponding tag. These should be functions that accept one parameter of type SKRenderAction and return an IEnumerable<SKRenderAction> of the render actions that will actually be added to the plot.
removeTaggedActionsAfterExecution	Whether the actions should be removed from *taggedActions* after their execution. Set to false if the same action should be performed on multiple items with the same tag.
width	The width of the document. If this is `null`, the width of the largest page is used.
height	The height of the document. If this is `null`, the height of the largest page is used.
background	The background colour of the document. If this is `null`, a transparent background is used.
textOption	Defines whether text items should be converted into paths when drawing.
filterOption	Defines how and whether image filters should be rasterised when rendering the image.

Returns

An Avalonia.Controls.Canvas containing the rendered graphics objects.

Definition at line 1592 of file SKRenderContext.cs.

7.140.2.5 PaintToSKCanvas() [2/6]

```
static SKMultiLayerRenderCanvas VectSharp.Canvas.SKRenderContextInterpreter.PaintToSKCanvas (
            this Document document,
            Dictionary< string, Func< SKRenderAction, IEnumerable< SKRenderAction > > >
taggedActions,
            Dictionary< string,(SKBitmap, bool)> images,
            bool removeTaggedActionsAfterExecution = true,
            double?  width = null,
            double?  height = null,
            Colour?  background = null,
            AvaloniaContextInterpreter.TextOptions textOption = AvaloniaContextInterpreter.TextOptions.Conver
            FilterOption filterOption = default )  [static]
```

Render a Document to an Avalonia.Controls.Canvas using the SkiaSharp renderer. Each page corresponds to a layer in the image.

Parameters

document	The Document to render.
taggedActions	A Dictionary containing the actions that will be performed on items with the corresponding tag. These should be functions that accept one parameter of type SKRenderAction and return an IEnumerable<SKRenderAction> of the render actions that will actually be added to the plot.
images	A dictionary that associates to each raster image path (or data URL) the image rendered as a SKBitmap and a boolean value indicating whether it should be drawn as "pixelated" or not. This will be populated automatically as the page is rendered. If you are rendering multiple Pages (or you are rendering the same page multiple times), it will be beneficial to keep a reference to this dictionary and pass it again on further rendering requests; otherwise, you can just pass an empty dictionary.
removeTaggedActionsAfterExecution	Whether the actions should be removed from *taggedActions* after their execution. Set to false if the same action should be performed on multiple items with the same tag.
width	The width of the document. If this is `null`, the width of the largest page is used.
height	The height of the document. If this is `null`, the height of the largest page is used.
background	The background colour of the document. If this is `null`, a transparent background is used.
textOption	Defines whether text items should be converted into paths when drawing.
filterOption	Defines how and whether image filters should be rasterised when rendering the image.

Returns

An Avalonia.Controls.Canvas containing the rendered graphics objects.

Definition at line 1614 of file SKRenderContext.cs.

7.140.2.6 PaintToSKCanvas() [3/6]

```
static SKMultiLayerRenderCanvas VectSharp.Canvas.SKRenderContextInterpreter.PaintToSKCanvas (
            this Document document,
            double?  width = null,
            double?  height = null,
            Colour?  background = null,
            AvaloniaContextInterpreter.TextOptions textOption = AvaloniaContextInterpreter.TextOptions.Conver
            FilterOption filterOption = default )  [static]
```

Render a Document to an Avalonia.Controls.Canvas using the SkiaSharp renderer. Each page corresponds to a layer in the image.

Parameters

document	The Document to render.
width	The width of the document. If this is `null`, the width of the largest page is used.
height	The height of the document. If this is `null`, the height of the largest page is used.
background	The background colour of the document. If this is `null`, a transparent background is used.
textOption	Defines whether text items should be converted into paths when drawing.
filterOption	Defines how and whether image filters should be rasterised when rendering the image.

Returns

An Avalonia.Controls.Canvas containing the rendered graphics objects.

Definition at line 1572 of file SKRenderContext.cs.

7.140.2.7 PaintToSKCanvas() [4/6]

```
static SKMultiLayerRenderCanvas VectSharp.Canvas.SKRenderContextInterpreter.PaintToSKCanvas (
            this Page page,
            AvaloniaContextInterpreter.TextOptions textOption = AvaloniaContextInterpreter.TextOptions.Conver
            FilterOption filterOption = default )  [static]
```

Render a Page to an Avalonia.Controls.Canvas using the SkiaSharp renderer.

Parameters

page	The Page to render.
textOption	Defines whether text items should be converted into paths when drawing.
filterOption	Defines how and whether image filters should be rasterised when rendering the image.

Returns

An Avalonia.Controls.Canvas containing the rendered graphics objects.

Definition at line 1628 of file SKRenderContext.cs.

7.140.2.8 PaintToSKCanvas() [5/6]

```
static SKMultiLayerRenderCanvas VectSharp.Canvas.SKRenderContextInterpreter.PaintToSKCanvas (
            this Page page,
            Dictionary< string, Func< SKRenderAction, IEnumerable< SKRenderAction > > >
taggedActions,
            bool removeTaggedActionsAfterExecution = true,
            AvaloniaContextInterpreter.TextOptions textOption = AvaloniaContextInterpreter.TextOptions.Conver
            FilterOption filterOption = default )  [static]
```

Render a Page to an Avalonia.Controls.Canvas using the SkiaSharpRenderer.

Parameters

page	The Page to render.
taggedActions	A Dictionary containing the actions that will be performed on items with the corresponding tag. These should be functions that accept one parameter of type SKRenderAction and return an IEnumerable<SKRenderAction> of the render actions that will actually be added to the plot.
removeTaggedActionsAfterExecution	Whether the actions should be removed from *taggedActions* after their execution. Set to false if the same action should be performed on multiple items with the same tag.
textOption	Defines whether text items should be converted into paths when drawing.
filterOption	Defines how and whether image filters should be rasterised when rendering the image.

Returns

An Avalonia.Controls.Canvas containing the rendered graphics objects.

Definition at line 1645 of file SKRenderContext.cs.

7.140.2.9 PaintToSKCanvas() [6/6]

```
static SKMultiLayerRenderCanvas VectSharp.Canvas.SKRenderContextInterpreter.PaintToSKCanvas (
            this Page page,
            Dictionary< string, Func< SKRenderAction, IEnumerable< SKRenderAction > > >
taggedActions,
            Dictionary< string,(SKBitmap, bool)> images,
```

```
bool removeTaggedActionsAfterExecution = true,
AvaloniaContextInterpreter.TextOptions textOption = AvaloniaContextInterpreter.TextOptions.Conver
FilterOption filterOption = default )  [static]
```

Render a Page to an Avalonia.Controls.Canvas using the SkiaSharpRenderer.

Parameters

page	The Page to render.
taggedActions	A Dictionary containing the actions that will be performed on items with the corresponding tag. These should be functions that accept one parameter of type SKRenderAction and return an IEnumerable<SKRenderAction> of the render actions that will actually be added to the plot.
images	A dictionary that associates to each raster image path (or data URL) the image rendered as a SKBitmap and a boolean value indicating whether it should be drawn as "pixelated" or not. This will be populated automatically as the page is rendered. If you are rendering multiple Pages (or you are rendering the same page multiple times), it will be beneficial to keep a reference to this dictionary and pass it again on further rendering requests; otherwise, you can just pass an empty dictionary.
removeTaggedActionsAfterExecution	Whether the actions should be removed from *taggedActions* after their execution. Set to false if the same action should be performed on multiple items with the same tag.
textOption	Defines whether text items should be converted into paths when drawing.
filterOption	Defines how and whether image filters should be rasterised when rendering the image.

Returns

An Avalonia.Controls.Canvas containing the rendered graphics objects.

Definition at line 1664 of file SKRenderContext.cs.

7.140.2.10 Rasterise()

```
static RasterImage VectSharp.Canvas.SKRenderContextInterpreter.Rasterise (
            this Graphics graphics,
            Rectangle region,
            double scale,
            bool interpolate )  [static]
```

Rasterise a region of a Graphics object.

Parameters

graphics	The Graphics object that will be rasterised.
region	The region of the *graphics* that will be rasterised.
scale	The scale at which the image will be rendered.
interpolate	Whether the resulting image should be interpolated or not when it is drawn on another Graphics surface.

Returns

A RasterImage containing the rasterised graphics.

Definition at line 1736 of file SKRenderContext.cs.

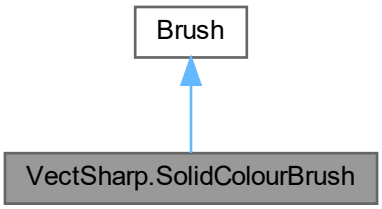
The documentation for this class was generated from the following file:

- VectSharp.Canvas/SKRenderContext.cs

7.141 VectSharp.SolidColourBrush Class Reference

Represents a brush painting with a single solid colour.

Inheritance diagram for VectSharp.SolidColourBrush:



Public Member Functions

- SolidColourBrush (Colour colour)

  Creates a new SolidColourBrush with the specified colour .
- override Brush MultiplyOpacity (double opacity)

  Returns a brush corresponding the current instance, with the specified opacity multiplication applied.

Parameters

opacity	*The value that will be used to multiply the opacity of the brush.*

Returns

A brush corresponding the current instance, with the specified opacity multiplication applied.

Static Public Member Functions

- static implicit operator SolidColourBrush (Colour colour)

  Implicitly converts a Colour into a SolidColourBrush.

Properties

- Colour Colour [get]

  The colour of the brush.
- double R [get]

  Red component of the colour. Range: [0, 1].
- double G [get]

  Green component of the colour. Range: [0, 1].
- double B [get]

  Blue component of the colour. Range: [0, 1].
- double A [get]

  Alpha component of the colour. Range: [0, 1].

7.141.1 Detailed Description

Represents a brush painting with a single solid colour.

Definition at line 54 of file Brush.cs.

7.141.2 Constructor & Destructor Documentation

7.141.2.1 SolidColourBrush()

```
VectSharp.SolidColourBrush.SolidColourBrush (
            Colour colour )
```

Creates a new SolidColourBrush with the specified *colour* .

Parameters

colour	The Colour to use for the brush.

Definition at line 85 of file Brush.cs.

7.141.3 Member Function Documentation

7.141.3.1 MultiplyOpacity()

```
override Brush VectSharp.SolidColourBrush.MultiplyOpacity (
            double opacity )  [virtual]
```

Returns a brush corresponding the current instance, with the specified *opacity* multiplication applied.

Parameters

opacity	The value that will be used to multiply the opacity of the brush.

Returns

A brush corresponding the current instance, with the specified *opacity* multiplication applied.

Implements VectSharp.Brush.

Definition at line 91 of file Brush.cs.

7.141.3.2 operator SolidColourBrush()

```
static implicit VectSharp.SolidColourBrush.operator SolidColourBrush (
            Colour colour )  [static]
```

Implicitly converts a Colour into a SolidColourBrush.

Parameters

colour	The Colour to use for the brush.

Definition at line 100 of file Brush.cs.

7.141.4 Property Documentation

7.141.4.1 A

```
double VectSharp.SolidColourBrush.A  [get]
```

Alpha component of the colour. Range: [0, 1].

Definition at line 79 of file Brush.cs.

7.141.4.2 B

```
double VectSharp.SolidColourBrush.B  [get]
```

Blue component of the colour. Range: [0, 1].

Definition at line 74 of file Brush.cs.

7.141.4.3 Colour

```
Colour VectSharp.SolidColourBrush.Colour  [get]
```

The colour of the brush.

Definition at line 59 of file Brush.cs.

7.141.4.4 G

```
double VectSharp.SolidColourBrush.G  [get]
```

Green component of the colour. Range: [0, 1].

Definition at line 69 of file Brush.cs.

7.141.4.5 R

```
double VectSharp.SolidColourBrush.R  [get]
```

Red component of the colour. Range: [0, 1].

Definition at line 64 of file Brush.cs.

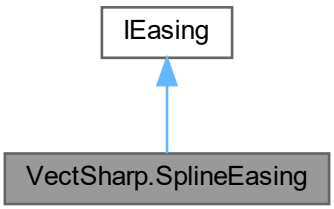
The documentation for this class was generated from the following file:

- VectSharp/Brush.cs

7.142 VectSharp.SplineEasing Class Reference

Describes an easing defined by a Cubic Bezier curve.

Inheritance diagram for VectSharp.SplineEasing:



Public Member Functions

- SplineEasing (Point controlPoint1, Point controlPoint2)

  Creates a new SplineEasing with the specified control points. The start point is always (0, 0) and the end point is always (1, 1).
- double Ease (double value)

  Applies the easing to the specified transition offset.

Parameters

value	*The transition offset (ranging from 0 to 1).*

Returns

The eased transition offset value.

Properties

- Point ControlPoint1 `[get]`

  The first control point of the curve.
- Point ControlPoint2 `[get]`

  The second control point of the curve.

7.142.1 Detailed Description

Describes an easing defined by a Cubic Bezier curve.

Definition at line 1233 of file Animation.cs.

7.142.2 Constructor & Destructor Documentation

7.142.2.1 SplineEasing()

```
VectSharp.SplineEasing.SplineEasing (
            Point controlPoint1,
            Point controlPoint2 )
```

Creates a new SplineEasing with the specified control points. The start point is always (0, 0) and the end point is always (1, 1).

Parameters

controlPoint1	The first control point of the curve. Both X and Y must be between 0 and 1, inclusive.
controlPoint2	The second control point of the curve. Both X and Y must be between 0 and 1, inclusive.

Exceptions

ArgumentException	This exception is thrown if any coordinate of the control points is < 0 or > 1.

Definition at line 1252 of file Animation.cs.

7.142.3 Member Function Documentation

7.142.3.1 Ease()

```
double VectSharp.SplineEasing.Ease (
            double value )
```

Applies the easing to the specified transition offset.

Parameters

value	The transition offset (ranging from 0 to 1).

Returns

The eased transition offset value.

Implements VectSharp.IEasing.

Definition at line 1301 of file Animation.cs.

7.142.4 Property Documentation

7.142.4.1 ControlPoint1

```
Point VectSharp.SplineEasing.ControlPoint1  [get]
```

The first control point of the curve.

Definition at line 1238 of file Animation.cs.

7.142.4.2 ControlPoint2

```
Point VectSharp.SplineEasing.ControlPoint2  [get]
```

The second control point of the curve.

Definition at line 1243 of file Animation.cs.

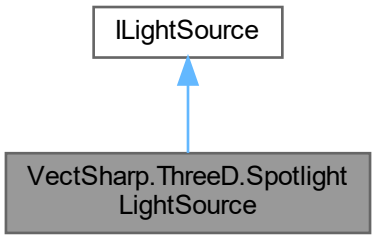
The documentation for this class was generated from the following file:

- VectSharp/Animation.cs

7.143 VectSharp.ThreeD.SpotlightLightSource Class Reference

Represents a conic spotlight.

Inheritance diagram for VectSharp.ThreeD.SpotlightLightSource:



Public Member Functions

- SpotlightLightSource (double intensity, Point3D position, NormalizedVector3D direction, double beamWidth↩ Angle, double cutoffAngle)

  Creates a new SpotlightLightSource instance.
- LightIntensity GetLightAt (Point3D point)

  Computes the light intensity at the specified point, without taking into account any obstructions.

Parameters

point	*The Point3DElement at which the light intensity should be computed.*

Returns

- double GetObstruction (Point3D point, IEnumerable< Triangle3DElement > shadowingTriangles)

  Determines the amount of obstruction of the light that results at point due to the specified shadowingTriangles .

Parameters

point	*The Point3D at which the obstruction should be computed.*
shadowingTriangles	*A collection of Triangle3DElement casting shadows.*

Returns

1 if the light is completely obstructed, 0 if the light is completely visible, a value between these if the light is partially obstructed.

Properties

- bool CastsShadow = true `[get, set]`

  Determines whether the light casts a shadow or not.
- Point3D Position `[get, set]`

The position of the light source.

- NormalizedVector3D Direction `[get, set]`

  The direction of the cone axis.

- double Intensity `[get, set]`

  The base intensity of the light.

- double BeamWidthAngle `[get, set]`

  The angular size of the light cone, in radians.

- double CutoffAngle `[get, set]`

  The angular size of the cutoff cone, in radians.

- double DistanceAttenuationExponent = 2 `[get, set]`

  An exponent determining how fast the light attenuates with increasing distance. Set to 0 to disable distance attenuation.

- double AngleAttenuationExponent = 1 `[get, set]`

  An exponent determining how fast the light attenuates between the main light cone and the cutoff cone.

7.143.1 Detailed Description

Represents a conic spotlight.

Definition at line 256 of file Lights.cs.

7.143.2 Constructor & Destructor Documentation

7.143.2.1 SpotlightLightSource()

```
VectSharp.ThreeD.SpotlightLightSource.SpotlightLightSource (
            double intensity,
            Point3D position,
            NormalizedVector3D direction,
            double beamWidthAngle,
            double cutoffAngle )
```

Creates a new SpotlightLightSource instance.

Parameters

intensity	The intensity of the light.
position	The position of the light source.
direction	The direction of the cone's axis.
beamWidthAngle	The angular size of the light cone, in radians.
cutoffAngle	The angular size of the cutoff cone, in radians.

Definition at line 304 of file Lights.cs.

7.143.3 Member Function Documentation

7.143.3.1 GetLightAt()

```
LightIntensity VectSharp.ThreeD.SpotlightLightSource.GetLightAt (
            Point3D point )
```

Computes the light intensity at the specified point, without taking into account any obstructions.

Parameters

point	The Point3DElement at which the light intensity should be computed.

Returns

Implements VectSharp.ThreeD.ILightSource.

Definition at line 314 of file Lights.cs.

7.143.3.2 GetObstruction()

```
double VectSharp.ThreeD.SpotlightLightSource.GetObstruction (
            Point3D point,
            IEnumerable< Triangle3DElement > shadowingTriangles )
```

Determines the amount of obstruction of the light that results at *point* due to the specified *shadowingTriangles* .

Parameters

point	The Point3D at which the obstruction should be computed.
shadowingTriangles	A collection of Triangle3DElement casting shadows.

Returns

1 if the light is completely obstructed, 0 if the light is completely visible, a value between these if the light is partially obstructed.

Implements VectSharp.ThreeD.ILightSource.

Definition at line 362 of file Lights.cs.

7.143.4 Property Documentation

7.143.4.1 AngleAttenuationExponent

```
double VectSharp.ThreeD.SpotlightLightSource.AngleAttenuationExponent = 1  [get], [set]
```

An exponent determining how fast the light attenuates between the main light cone and the cutoff cone.

Definition at line 294 of file Lights.cs.

7.143.4.2 BeamWidthAngle

```
double VectSharp.ThreeD.SpotlightLightSource.BeamWidthAngle  [get], [set]
```

The angular size of the light cone, in radians.

Definition at line 279 of file Lights.cs.

7.143.4.3 CastsShadow

```
bool VectSharp.ThreeD.SpotlightLightSource.CastsShadow = true  [get], [set]
```

Determines whether the light casts a shadow or not.

Implements VectSharp.ThreeD.ILightSource.

Definition at line 259 of file Lights.cs.

7.143.4.4 CutoffAngle

```
double VectSharp.ThreeD.SpotlightLightSource.CutoffAngle  [get], [set]
```

The angular size of the cutoff cone, in radians.

Definition at line 284 of file Lights.cs.

7.143.4.5 Direction

```
NormalizedVector3D VectSharp.ThreeD.SpotlightLightSource.Direction  [get], [set]
```

The direction of the cone axis.

Definition at line 269 of file Lights.cs.

7.143.4.6 DistanceAttenuationExponent

```
double VectSharp.ThreeD.SpotlightLightSource.DistanceAttenuationExponent = 2  [get], [set]
```

An exponent determining how fast the light attenuates with increasing distance. Set to 0 to disable distance attenuation.

Definition at line 289 of file Lights.cs.

7.143.4.7 Intensity

```
double VectSharp.ThreeD.SpotlightLightSource.Intensity  [get], [set]
```

The base intensity of the light.

Definition at line 274 of file Lights.cs.

7.143.4.8 Position

```
Point3D VectSharp.ThreeD.SpotlightLightSource.Position  [get], [set]
```

The position of the light source.

Definition at line 264 of file Lights.cs.

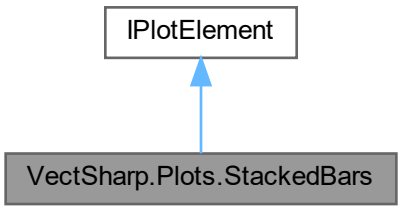
The documentation for this class was generated from the following file:

- VectSharp.ThreeD/Lights.cs

7.144 VectSharp.Plots.StackedBars Class Reference

A plot element that draws stacked bars.

Inheritance diagram for VectSharp.Plots.StackedBars:



Public Member Functions

- StackedBars (IEnumerable< IReadOnlyList< double > > data, IComparer< IReadOnlyList< double > > sorting, Func< IReadOnlyList< double >, IReadOnlyList< double > > getBaseline, ICoordinateSystem< IReadOnlyList< double > > coordinateSystem)

  Create a new StackedBars instance.
- StackedBars (IEnumerable< IReadOnlyList< double > > data, Comparison< IReadOnlyList< double > > sorting, Func< IReadOnlyList< double >, IReadOnlyList< double > > getBaseline, ICoordinateSystem< IReadOnlyList< double > > coordinateSystem)

  Create a new StackedBars instance.
- StackedBars (IEnumerable< IReadOnlyList< double > > data, ICoordinateSystem< IReadOnlyList< double > > coordinateSystem, bool vertical=true)

  Create a new StackedBars instance.
- void Plot (Graphics target)

  Draw the plot element on the specified target Graphics.

Parameters

target	*The Graphics on which to draw.*

Properties

- bool Vertical = true `[get, set]`

  If this is `true`, the bars rise vertically above the X axis Otherwise, the bars grow horizontally from the Y axis.
- SortedSet< IReadOnlyList< double > > Data `[get, set]`

  The data points corresponding to the tips of the bars. For each bar stack, the data point contains an element determining the position of the bar on the X axis (if Vertical is `true`, or on the Y axis otherwise), and a set of elements determining the length of each segment in the bar stack.
- Func< IReadOnlyList< double >, IReadOnlyList< double > > GetBaseline `[get, set]`

  A function that returns the bottom for each bar. This function should accept a single parameter (an IReadOnlyList<T> of `double`s), and return another object of the same type, representing the bottom of the bar in data space.
- double Margin `[get, set]`

  The margin between consecutive bars. This should range between 0 and 1.
- ICoordinateSystem< IReadOnlyList< double > > CoordinateSystem `[get, set]`

  The coordinate system used to transform the points from data space to plot space.
- IReadOnlyList< PlotElementPresentationAttributes > PresentationAttributes = new PlotElementPresentationAttributes[ ] { new PlotElementPresentationAttributes() } `[get, set]`

  Presentation attributes for the bars. An element from this collection is used for each segment in the stack; if there are more segments than elements in this collection, the presentation attributes are wrapped.
- string Tag `[get, set]`

  A tag to identify the stacked bars in the plot.

7.144.1 Detailed Description

A plot element that draws stacked bars.

Definition at line 325 of file Bars.cs.

7.144.2 Constructor & Destructor Documentation

7.144.2.1 StackedBars() [1/3]

```
VectSharp.Plots.StackedBars.StackedBars (
            IEnumerable< IReadOnlyList< double > > data,
            IComparer< IReadOnlyList< double > > sorting,
            Func< IReadOnlyList< double >, IReadOnlyList< double > > getBaseline,
            ICoordinateSystem< IReadOnlyList< double > > coordinateSystem )
```

Create a new StackedBars instance.

Parameters

data	The data points corresponding to the tips of the bars. For each bar stack, the data point contains an element determining the position of the bar on the X axis (if Vertical is `true`, or on the Y axis otherwise), and a set of elements determining the length of each segment in the bar stack.
sorting	A comparer used to sort the bars.
getBaseline	A function that returns the bottom for each bar. This function should accept a single parameter (an IReadOnlyList<T> of `double`s), and return another object of the same type, representing the bottom of the bar in data space.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 399 of file Bars.cs.

7.144.2.2 StackedBars() [2/3]

```
VectSharp.Plots.StackedBars.StackedBars (
            IEnumerable< IReadOnlyList< double > > data,
            Comparison< IReadOnlyList< double > > sorting,
            Func< IReadOnlyList< double >, IReadOnlyList< double > > getBaseline,
            ICoordinateSystem< IReadOnlyList< double > > coordinateSystem )
```

Create a new StackedBars instance.

Parameters

data	The data points corresponding to the tips of the bars. For each bar stack, the data point contains an element determining the position of the bar on the X axis (if Vertical is `true`, or on the Y axis otherwise), and a set of elements determining the length of each segment in the bar stack.
sorting	A comparer used to sort the bars.
getBaseline	A function that returns the bottom for each bar. This function should accept a single parameter (an IReadOnlyList<T> of `double`s), and return another object of the same type, representing the bottom of the bar in data space.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 418 of file Bars.cs.

7.144.2.3 StackedBars() [3/3]

```
VectSharp.Plots.StackedBars.StackedBars (
            IEnumerable< IReadOnlyList< double > > data,
            ICoordinateSystem< IReadOnlyList< double > > coordinateSystem,
            bool vertical = true )
```

Create a new StackedBars instance.

Parameters

data	The data points corresponding to the tips of the bars. For each bar stack, the data point contains an element determining the position of the bar on the X axis (if *vertical* is `true`, or on the Y axis otherwise), and a set of elements determining the length of each segment in the bar stack.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.
vertical	If this is `true` (the default), the bars rise vertically above the X axis Otherwise, the bars grow horizontally from the Y axis.

Definition at line 430 of file Bars.cs.

7.144.3 Member Function Documentation

7.144.3.1 Plot()

```
void VectSharp.Plots.StackedBars.Plot (
            Graphics target )
```

Draw the plot element on the specified *target* Graphics.

Parameters

target	The Graphics on which to draw.

Implements VectSharp.Plots.IPlotElement.

Definition at line 433 of file Bars.cs.

7.144.4 Property Documentation

7.144.4.1 CoordinateSystem

```
ICoordinateSystem<IReadOnlyList<double> > VectSharp.Plots.StackedBars.CoordinateSystem  [get],
[set]
```

The coordinate system used to transform the points from data space to plot space.

Implements VectSharp.Plots.IPlotElement.

Definition at line 372 of file Bars.cs.

7.144.4.2 Data

```
SortedSet<IReadOnlyList<double> > VectSharp.Plots.StackedBars.Data  [get], [set]
```

The data points corresponding to the tips of the bars. For each bar stack, the data point contains an element determining the position of the bar on the X axis (if Vertical is `true`, or on the Y axis otherwise), and a set of elements determining the length of each segment in the bar stack.

Definition at line 341 of file Bars.cs.

7.144.4.3 GetBaseline

```
Func<IReadOnlyList<double>, IReadOnlyList<double> > VectSharp.Plots.StackedBars.GetBaseline
[get], [set]
```

A function that returns the bottom for each bar. This function should accept a single parameter (an IReadOnly↩ List<T> of `double`s), and return another object of the same type, representing the bottom of the bar in data space.

Definition at line 348 of file Bars.cs.

7.144.4.4 Margin

```
double VectSharp.Plots.StackedBars.Margin  [get], [set]
```

The margin between consecutive bars. This should range between 0 and 1.

Definition at line 353 of file Bars.cs.

7.144.4.5 PresentationAttributes

```
IReadOnlyList<PlotElementPresentationAttributes> VectSharp.Plots.StackedBars.Presentation↩
Attributes = new PlotElementPresentationAttributes[] { new PlotElementPresentationAttributes()
}  [get], [set]
```

Presentation attributes for the bars. An element from this collection is used for each segment in the stack; if there are more segments than elements in this collection, the presentation attributes are wrapped.

Definition at line 380 of file Bars.cs.

7.144.4.6 Tag

```
string VectSharp.Plots.StackedBars.Tag  [get], [set]
```

A tag to identify the stacked bars in the plot.

Definition at line 385 of file Bars.cs.

7.144.4.7 Vertical

```
bool VectSharp.Plots.StackedBars.Vertical = true  [get], [set]
```

If this is `true`, the bars rise vertically above the X axis Otherwise, the bars grow horizontally from the Y axis.

Definition at line 333 of file Bars.cs.

The documentation for this class was generated from the following file:

- VectSharp.Plots/Bars.cs

7.145 VectSharp.SVG.SVGContextInterpreter Class Reference

Contains methods to render a Page as an SVG file.

Classes

- class FilterOption
  Determines how and whether image filters are rasterised.

Public Types

- enum TextOptions
  Defines whether the used fonts should be included in the file.

Static Public Member Functions

- static void SaveAsSVG (this Page page, string fileName, TextOptions textOption=TextOptions.SubsetFonts, Dictionary< string, string > linkDestinations=null, FilterOption filterOption=default, bool useStyles=false)

  Render the page to an SVG file.
- static void SaveAsSVG (this Page page, Stream stream, TextOptions textOption=TextOptions.SubsetFonts, Dictionary< string, string > linkDestinations=null, FilterOption filterOption=default, bool useStyles=false)

  Render the page to an SVG stream.
- static XmlDocument SaveAsSVG (this Page page, TextOptions textOption=TextOptions.SubsetFonts, Dictionary< string, string > linkDestinations=null, FilterOption filterOption=default, bool useStyles=false)

  Render the page to an SVG document.
- static XmlDocument SaveAsAnimatedSVG (this Animation animation, bool includeControls=false, double durationScaling=1, TextOptions textOption=TextOptions.SubsetFonts, Dictionary< string, string > linkDestinations=null, FilterOption filterOption=default)

  Render the animation to an SVG document, using SVG animations.
- static void SaveAsAnimatedSVG (this Animation animation, Stream stream, bool includeControls=false, double durationScaling=1, TextOptions textOption=TextOptions.SubsetFonts, Dictionary< string, string > linkDestinations=null, FilterOption filterOption=default)

  Render the animation to an SVG stream, using SVG animations.
- static void SaveAsAnimatedSVG (this Animation animation, string fileName, bool includeControls=false, double durationScaling=1, TextOptions textOption=TextOptions.SubsetFonts, Dictionary< string, string > linkDestinations=null, FilterOption filterOption=default)

  Render the animation to an SVG file, using SVG animations.
- static XmlDocument SaveAsAnimatedSVGWithFrames (this Animation animation, bool includeControls=false, double frameRate=60, double durationScaling=1, TextOptions textOption=TextOptions.SubsetFonts, Dictionary< string, string > linkDestinations=null, FilterOption filterOption=default)

  Render the animation to an SVG document, encoding discrete frames.
- static void SaveAsAnimatedSVGWithFrames (this Animation animation, Stream stream, bool includeControls=false, double frameRate=60, double durationScaling=1, TextOptions textOption=TextOptions.SubsetFonts, Dictionary< string, string > linkDestinations=null, FilterOption filterOption=default)

  Render the animation to an SVG stream, encoding discrete frames.
- static void SaveAsAnimatedSVGWithFrames (this Animation animation, string fileName, bool includeControls=false, double frameRate=60, double durationScaling=1, TextOptions textOption=TextOptions.SubsetFonts, Dictionary< string, string > linkDestinations=null, FilterOption filterOption=default)

  Render the animation to an SVG file, encoding discrete frames.

7.145.1 Detailed Description

Contains methods to render a Page as an SVG file.

Definition at line 2226 of file SVGContext.cs.

7.145.2 Member Enumeration Documentation

7.145.2.1 TextOptions

`enum VectSharp.SVG.SVGContextInterpreter.TextOptions`

Defines whether the used fonts should be included in the file.

Definition at line 2249 of file SVGContext.cs.

7.145.3 Member Function Documentation

7.145.3.1 SaveAsAnimatedSVG() [1/3]

```
static XmlDocument VectSharp.SVG.SVGContextInterpreter.SaveAsAnimatedSVG (
            this Animation animation,
            bool includeControls = false,
            double durationScaling = 1,
            TextOptions textOption = TextOptions.SubsetFonts,
            Dictionary< string, string > linkDestinations = null,
            FilterOption filterOption = default )  [static]
```

Render the animation to an SVG document, using SVG animations.

Parameters

animation	The Animation to render.
includeControls	If this is `true`, the generated SVG file will contain playback controls that use Javascript to play/pause the animation and change the current time.
durationScaling	A scaling factor that will be applied to all durations in the animation. Values greater than 1 slow down the animation, values smaller than 1 accelerate it. Note that this does not affect the frame rate of the animation.
textOption	Defines whether the used fonts should be included in the file.
linkDestinations	A dictionary associating element tags to link targets. If this is provided, objects that have been drawn with a tag contained in the dictionary will become hyperlink to the destination specified in the dictionary. If the destination starts with a hash (#), it is interpreted as the tag of another object in the current document; otherwise, it is interpreted as an external URI.
filterOption	Defines how and whether image filters should be rasterised when rendering the image.

Returns

An XmlDocument containing the animated SVG image.

Definition at line 2719 of file SVGContext.cs.

7.145.3.2 SaveAsAnimatedSVG() [2/3]

```
static void VectSharp.SVG.SVGContextInterpreter.SaveAsAnimatedSVG (
            this Animation animation,
            Stream stream,
            bool includeControls = false,
            double durationScaling = 1,
            TextOptions textOption = TextOptions.SubsetFonts,
            Dictionary< string, string > linkDestinations = null,
            FilterOption filterOption = default )  [static]
```

Render the animation to an SVG stream, using SVG animations.

Parameters

animation	The Animation to render.
stream	The Stream on which the SVG document will be written.
includeControls	If this is `true`, the generated SVG file will contain playback controls that use Javascript to play/pause the animation and change the current time.
durationScaling	A scaling factor that will be applied to all durations in the animation. Values greater than 1 slow down the animation, values smaller than 1 accelerate it. Note that this does not affect the frame rate of the animation.
textOption	Defines whether the used fonts should be included in the file.
linkDestinations	A dictionary associating element tags to link targets. If this is provided, objects that have been drawn with a tag contained in the dictionary will become hyperlink to the destination specified in the dictionary. If the destination starts with a hash (#), it is interpreted as the tag of another object in the current document; otherwise, it is interpreted as an external URI.
filterOption	Defines how and whether image filters should be rasterised when rendering the image.

Definition at line 3218 of file SVGContext.cs.

7.145.3.3 SaveAsAnimatedSVG() [3/3]

```
static void VectSharp.SVG.SVGContextInterpreter.SaveAsAnimatedSVG (
            this Animation animation,
            string fileName,
            bool includeControls = false,
            double durationScaling = 1,
            TextOptions textOption = TextOptions.SubsetFonts,
            Dictionary< string, string > linkDestinations = null,
            FilterOption filterOption = default )  [static]
```

Render the animation to an SVG file, using SVG animations.

Parameters

animation	The Animation to render.
fileName	The output file that will be created.
includeControls	If this is `true`, the generated SVG file will contain playback controls that use Javascript to play/pause the animation and change the current time.
durationScaling	A scaling factor that will be applied to all durations in the animation. Values greater than 1 slow down the animation, values smaller than 1 accelerate it. Note that this does not affect the frame rate of the animation.
textOption	Defines whether the used fonts should be included in the file.
linkDestinations	A dictionary associating element tags to link targets. If this is provided, objects that have been drawn with a tag contained in the dictionary will become hyperlink to the destination specified in the dictionary. If the destination starts with a hash (#), it is interpreted as the tag of another object in the current document; otherwise, it is interpreted as an external URI.
filterOption	Defines how and whether image filters should be rasterised when rendering the image.

Definition at line 3234 of file SVGContext.cs.

7.145.3.4 SaveAsAnimatedSVGWithFrames() [1/3]

```
static XmlDocument VectSharp.SVG.SVGContextInterpreter.SaveAsAnimatedSVGWithFrames (
            this Animation animation,
            bool includeControls = false,
            double frameRate = 60,
            double durationScaling = 1,
            TextOptions textOption = TextOptions.SubsetFonts,
            Dictionary< string, string > linkDestinations = null,
            FilterOption filterOption = default )  [static]
```

Render the animation to an SVG document, encoding discrete frames.

Parameters

animation	The Animation to render.
includeControls	If this is `true`, the generated SVG file will contain playback controls that use Javascript to play/pause the animation and change the current time.
frameRate	The target frame rate of the animation, in frames-per-second (fps).
durationScaling	A scaling factor that will be applied to all durations in the animation. Values greater than 1 slow down the animation, values smaller than 1 accelerate it. Note that this does not affect the frame rate of the animation.
textOption	Defines whether the used fonts should be included in the file.
linkDestinations	A dictionary associating element tags to link targets. If this is provided, objects that have been drawn with a tag contained in the dictionary will become hyperlink to the destination specified in the dictionary. If the destination starts with a hash (#), it is interpreted as the tag of another object in the current document; otherwise, it is interpreted as an external URI.
filterOption	Defines how and whether image filters should be rasterised when rendering the image.

Returns

An XmlDocument containing the animated SVG image.

Definition at line 3253 of file SVGContext.cs.

7.145.3.5 SaveAsAnimatedSVGWithFrames() [2/3]

```
static void VectSharp.SVG.SVGContextInterpreter.SaveAsAnimatedSVGWithFrames (
            this Animation animation,
            Stream stream,
            bool includeControls = false,
            double frameRate = 60,
            double durationScaling = 1,
            TextOptions textOption = TextOptions.SubsetFonts,
            Dictionary< string, string > linkDestinations = null,
            FilterOption filterOption = default )  [static]
```

Render the animation to an SVG stream, encoding discrete frames.

Parameters

animation	The Animation to render.
includeControls	If this is `true`, the generated SVG file will contain playback controls that use Javascript to play/pause the animation and change the current time.
stream	The Stream on which the SVG document will be written.
frameRate	The target frame rate of the animation, in frames-per-second (fps).
durationScaling	A scaling factor that will be applied to all durations in the animation. Values greater than 1 slow down the animation, values smaller than 1 accelerate it. Note that this does not affect the frame rate of the animation.
textOption	Defines whether the used fonts should be included in the file.
linkDestinations	A dictionary associating element tags to link targets. If this is provided, objects that have been drawn with a tag contained in the dictionary will become hyperlink to the destination specified in the dictionary. If the destination starts with a hash (#), it is interpreted as the tag of another object in the current document; otherwise, it is interpreted as an external URI.
filterOption	Defines how and whether image filters should be rasterised when rendering the image.

Definition at line 3333 of file SVGContext.cs.

7.145.3.6 SaveAsAnimatedSVGWithFrames() [3/3]

```
static void VectSharp.SVG.SVGContextInterpreter.SaveAsAnimatedSVGWithFrames (
            this Animation animation,
            string fileName,
            bool includeControls = false,
            double frameRate = 60,
            double durationScaling = 1,
            TextOptions textOption = TextOptions.SubsetFonts,
            Dictionary< string, string > linkDestinations = null,
            FilterOption filterOption = default )  [static]
```

Render the animation to an SVG file, encoding discrete frames.

Parameters

animation	The Animation to render.
includeControls	If this is `true`, the generated SVG file will contain playback controls that use Javascript to play/pause the animation and change the current time.
fileName	The output file that will be created.
frameRate	The target frame rate of the animation, in frames-per-second (fps).
durationScaling	A scaling factor that will be applied to all durations in the animation. Values greater than 1 slow down the animation, values smaller than 1 accelerate it. Note that this does not affect the frame rate of the animation.
textOption	Defines whether the used fonts should be included in the file.
linkDestinations	A dictionary associating element tags to link targets. If this is provided, objects that have been drawn with a tag contained in the dictionary will become hyperlink to the destination specified in the dictionary. If the destination starts with a hash (#), it is interpreted as the tag of another object in the current document; otherwise, it is interpreted as an external URI.
filterOption	Defines how and whether image filters should be rasterised when rendering the image.

Definition at line 3350 of file SVGContext.cs.

7.145.3.7 SaveAsSVG() [1/3]

```
static void VectSharp.SVG.SVGContextInterpreter.SaveAsSVG (
            this Page page,
            Stream stream,
            TextOptions textOption = TextOptions.SubsetFonts,
            Dictionary< string, string > linkDestinations = null,
            FilterOption filterOption = default,
            bool useStyles = false )  [static]
```

Render the page to an SVG stream.

Parameters

page	The Page to render.
stream	The stream to which the SVG data will be written.
textOption	Defines whether the used fonts should be included in the file.
linkDestinations	A dictionary associating element tags to link targets. If this is provided, objects that have been drawn with a tag contained in the dictionary will become hyperlink to the destination specified in the dictionary. If the destination starts with a hash (#), it is interpreted as the tag of another object in the current document; otherwise, it is interpreted as an external URI.
filterOption	Defines how and whether image filters should be rasterised when rendering the image.
useStyles	If this is `false`, presentation attributes are set as attributes on SVG elements. If this is `true`, CSS classes are used to set presentation attributes.

Definition at line 2361 of file SVGContext.cs.

7.145.3.8 SaveAsSVG() [2/3]

```
static void VectSharp.SVG.SVGContextInterpreter.SaveAsSVG (
            this Page page,
            string fileName,
            TextOptions textOption = TextOptions.SubsetFonts,
            Dictionary< string, string > linkDestinations = null,
            FilterOption filterOption = default,
            bool useStyles = false )  [static]
```

Render the page to an SVG file.

Parameters

page	The Page to render.
fileName	The full path to the file to save. If it exists, it will be overwritten.
textOption	Defines whether the used fonts should be included in the file.

Parameters

linkDestinations	A dictionary associating element tags to link targets. If this is provided, objects that have been drawn with a tag contained in the dictionary will become hyperlink to the destination specified in the dictionary. If the destination starts with a hash (#), it is interpreted as the tag of another object in the current document; otherwise, it is interpreted as an external URI.
filterOption	Defines how and whether image filters should be rasterised when rendering the image.
useStyles	If this is `false`, presentation attributes are set as attributes on SVG elements. If this is `true`, CSS classes are used to set presentation attributes.

Definition at line 2238 of file SVGContext.cs.

7.145.3.9 SaveAsSVG() [3/3]

```
static XmlDocument VectSharp.SVG.SVGContextInterpreter.SaveAsSVG (
            this Page page,
            TextOptions textOption = TextOptions.SubsetFonts,
            Dictionary< string, string > linkDestinations = null,
            FilterOption filterOption = default,
            bool useStyles = false )  [static]
```

Render the page to an SVG document.

Parameters

page	The Page to render.
textOption	Defines whether the used fonts should be included in the file.
linkDestinations	A dictionary associating element tags to link targets. If this is provided, objects that have been drawn with a tag contained in the dictionary will become hyperlink to the destination specified in the dictionary. If the destination starts with a hash (#), it is interpreted as the tag of another object in the current document; otherwise, it is interpreted as an external URI.
filterOption	Defines how and whether image filters should be rasterised when rendering the image.
useStyles	If this is `false`, presentation attributes are set as attributes on SVG elements. If this is `true`, CSS classes are used to set presentation attributes.

Returns

An XmlDocument containing the rendered SVG image.

Definition at line 2376 of file SVGContext.cs.

The documentation for this class was generated from the following file:

- VectSharp.SVG/SVGContext.cs

7.146 VectSharp.Markdown.SyntaxHighlighter Class Reference

Contains methods to perform syntax highlighting.

Static Public Member Functions

- static List< List< FormattedString > > GetSyntaxHighlightedLines (string sourceCode, string language)

  Performs syntax highlighting for a specified language on some source code.

7.146.1 Detailed Description

Contains methods to perform syntax highlighting.

Definition at line 73 of file SyntaxHighlighting.cs.

7.146.2 Member Function Documentation

7.146.2.1 GetSyntaxHighlightedLines()

```
static List< List< FormattedString > > VectSharp.Markdown.SyntaxHighlighter.GetSyntaxHighlighted↩
Lines (
            string sourceCode,
            string language )  [static]
```

Performs syntax highlighting for a specified language on some source code.

Parameters

sourceCode	The source code to be highlighted.
language	The name of the language to use for the highlighting.

Returns

A list of lists of FormattedStrings. Each list of FormattedStrings represents a line.

Definition at line 129 of file SyntaxHighlighting.cs.

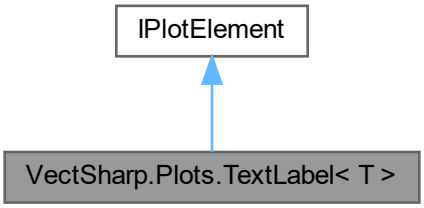
The documentation for this class was generated from the following file:

- VectSharp.Markdown/SyntaxHighlighting.cs

7.147 VectSharp.Plots.TextLabel< T > Class Template Reference

A plot element that draws a single text label.

Inheritance diagram for VectSharp.Plots.TextLabel< T >:



Public Member Functions

- TextLabel (string label, T position, ICoordinateSystem< T > coordinateSystem)

  Create a new TextLabel< T > instance.
- void Plot (Graphics target)

  Draw the plot element on the specified target Graphics.

Parameters

target	*The Graphics on which to draw.*

Properties

- T Position `[get, set]`

  The position of the label, in data space coordinates.
- string Label `[get, set]`

  The text of the label. This can include formatting specifiers (see the documentation for the FormattedText.Format(string, Font, Font, Font, F method).
- double Rotation = 0 `[get, set]`

  The angle at which the text is drawn, with respect to the horizontal.
- TextBaselines Baseline = TextBaselines.Middle `[get, set]`

  The baseline for the text.
- TextAnchors Alignment = TextAnchors.Center `[get, set]`

  The alignment for the text.
- ICoordinateSystem< T > CoordinateSystem `[get, set]`

  The coordinate system used to transform the points from data space to plot space.
- PlotElementPresentationAttributes PresentationAttributes = new PlotElementPresentationAttributes() { Stroke = null } `[get, set]`

  Presentation attributes determining the appearance (stroke and fill colour, etc.) of the text label.
- string Tag `[get, set]`

  A tag to identify the label in the plot.

7.147.1 Detailed Description

A plot element that draws a single text label.

Template Parameters

T	The kind of data describing the data points (generally, `IReadOnlyList<double>`).

Definition at line 226 of file DataPoints.cs.

7.147.2 Constructor & Destructor Documentation

7.147.2.1 TextLabel()

```
VectSharp.Plots.TextLabel< T >.TextLabel (
            string label,
            T position,
            ICoordinateSystem< T > coordinateSystem )
```

Create a new TextLabel<T> instance.

Parameters

label	The text of the label. This can include formatting specifiers (see the documentation for the FormattedText.Format(string, Font, Font, Font, Font, Brush) method).
position	The position of the label, in data space coordinates.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 275 of file DataPoints.cs.

7.147.3 Member Function Documentation

7.147.3.1 Plot()

```
void VectSharp.Plots.TextLabel< T >.Plot (
            Graphics target )
```

Draw the plot element on the specified *target* Graphics.

Parameters

target	The Graphics on which to draw.

Implements VectSharp.Plots.IPlotElement.

Definition at line 283 of file DataPoints.cs.

7.147.4 Property Documentation

7.147.4.1 Alignment

```
TextAnchors VectSharp.Plots.TextLabel< T >.Alignment = TextAnchors.Center  [get], [set]
```

The alignment for the text.

Definition at line 251 of file DataPoints.cs.

7.147.4.2 Baseline

```
TextBaselines VectSharp.Plots.TextLabel< T >.Baseline = TextBaselines.Middle  [get], [set]
```

The baseline for the text.

Definition at line 246 of file DataPoints.cs.

7.147.4.3 CoordinateSystem

```
ICoordinateSystem<T> VectSharp.Plots.TextLabel< T >.CoordinateSystem  [get], [set]
```

The coordinate system used to transform the points from data space to plot space.

Implements VectSharp.Plots.IPlotElement.

Definition at line 256 of file DataPoints.cs.

7.147.4.4 Label

```
string VectSharp.Plots.TextLabel< T >.Label  [get], [set]
```

The text of the label. This can include formatting specifiers (see the documentation for the FormattedText.Format(string, Font, Font, For
method).

Definition at line 236 of file DataPoints.cs.

7.147.4.5 Position

```
T VectSharp.Plots.TextLabel< T >.Position  [get], [set]
```

The position of the label, in data space coordinates.

Definition at line 231 of file DataPoints.cs.

7.147.4.6 PresentationAttributes

```
PlotElementPresentationAttributes VectSharp.Plots.TextLabel< T >.PresentationAttributes = new
PlotElementPresentationAttributes() { Stroke = null }  [get], [set]
```

Presentation attributes determining the appearance (stroke and fill colour, etc.) of the text label.

Definition at line 262 of file DataPoints.cs.

7.147.4.7 Rotation

```
double VectSharp.Plots.TextLabel< T >.Rotation = 0  [get], [set]
```

The angle at which the text is drawn, with respect to the horizontal.

Definition at line 241 of file DataPoints.cs.

7.147.4.8 Tag

```
string VectSharp.Plots.TextLabel< T >.Tag  [get], [set]
```

A tag to identify the label in the plot.

Definition at line 267 of file DataPoints.cs.

The documentation for this class was generated from the following file:

- VectSharp.Plots/DataPoints.cs

7.148 VectSharp.Transition Class Reference

Describes the transition between two successive Frames.

Public Member Functions

- Transition (double duration, IEasing easing=null, Dictionary< string, IEasing > easings=null)

  Creates a new Transition with the specified duration and easings.

Properties

- double Duration [get]

  The duration of the transition, in milliseconds.
- IEasing OverallEasing = null [get]

  The IEasing to apply to all elements for which another easing is not specified. Set to null to use the default linear easing.
- Dictionary< string, IEasing > Easings = null [get]

  A dictionary associating graphic action tags to the corresponding IEasing.

7.148.1 Detailed Description

Describes the transition between two successive Frames.

Definition at line 1341 of file Animation.cs.

7.148.2 Constructor & Destructor Documentation

7.148.2.1 Transition()

```
VectSharp.Transition.Transition (
            double duration,
            IEasing easing = null,
            Dictionary< string, IEasing > easings = null )
```

Creates a new Transition with the specified duration and easings.

Parameters

duration	The duration of the transition, in milliseconds.
easing	The IEasing to apply to all elements for which another easing is not specified. Set to null to use the default linear easing.
easings	A dictionary associating graphic action tags to the corresponding IEasing.

Definition at line 1364 of file Animation.cs.

7.148.3 Property Documentation

7.148.3.1 Duration

```
double VectSharp.Transition.Duration  [get]
```

The duration of the transition, in milliseconds.

Definition at line 1346 of file Animation.cs.

7.148.3.2 Easings

```
Dictionary<string, IEasing> VectSharp.Transition.Easings = null  [get]
```

A dictionary associating graphic action tags to the corresponding IEasing.

Definition at line 1356 of file Animation.cs.

7.148.3.3 OverallEasing

```
IEasing VectSharp.Transition.OverallEasing = null  [get]
```

The IEasing to apply to all elements for which another easing is not specified. Set to null to use the default linear easing.

Definition at line 1351 of file Animation.cs.

The documentation for this class was generated from the following file:

- VectSharp/Animation.cs

7.149 VectSharp.TrueTypeFile Class Reference

Represents a font file in TrueType format. Reference: http://stevehanov.ca/blog/?id=143, https://developer.apple.com/fonts/TrueType-Reference-Manual/, https://docs.↩microsoft.com/en-us/typography/opentype/spec/

Classes

- struct Bearings

  Represents the left- and right-side bearings of a glyph.
- class PairKerning

  Contains information describing how the position of two glyphs in a kerning pair should be altered.
- struct TrueTypeName

  Represets a TrueType name.
- struct TrueTypePoint

  Represents a point in a TrueType path description.
- struct VerticalMetrics

  Represents the maximum heigth above and depth below the baseline of a glyph.

Public Member Functions

- void Destroy ()

  Remove this TrueType file from the cache, clear the tables and release the FontStream. Only call this when the actual file that was used to create this object needs to be changed!
- TrueTypeFile SubsetFont (string charactersToInclude, bool consolidateAt32=false, Dictionary< char, char > outputEncoding=null)

  Create a subset of the TrueType file, containing only the glyphs for the specified characters.
- string GetFontFamilyName ()

  Obtains the font family name from the TrueType file.
- string GetFullFontFamilyName ()

  Obtains the full font family name from the TrueType file.
- string GetFontName ()

  Obtains the PostScript font name from the TrueType file.
- ushort GetFirstCharIndex ()

  Returns the index of the first character glyph represented by the font.
- ushort GetLastCharIndex ()

  Returns the index of the last character glyph represented by the font.
- bool IsItalic ()

  Determines whether the typeface is Italic or Oblique or not.
- bool IsOblique ()

  Determines whether the typeface is Oblique or not.
- bool IsBold ()

  Determines whether the typeface is Bold or not.
- bool IsFixedPitch ()

  Determines whether the typeface is fixed-pitch (aka monospaces) or not.
- bool IsSerif ()

  Determines whether the typeface is serifed or not.
- bool IsScript ()

  Determines whether the typeface is a script typeface or not.
- int GetGlyphIndex (char glyph)

  Determines the index of the glyph corresponding to a certain character.
- TrueTypePoint[ ][ ] GetGlyphPath (int glyphIndex, double size)

  Get the path that describes the shape of a glyph.
- TrueTypePoint[ ][ ] GetGlyphPath (char glyph, double size)

  Get the path that describes the shape of a glyph.
- double Get1000EmGlyphWidth (char glyph)

  Computes the advance width of a glyph, in thousandths of em unit.
- double Get1000EmGlyphWidth (int glyphIndex)

  Computes the advance width of a glyph, in thousandths of em unit.
- double Get1000EmWinAscent ()

  Computes the font's Win ascent, in thousandths of em unit.
- double Get1000EmAscent ()

  Computes the font ascent, in thousandths of em unit.
- double Get1000EmDescent ()

  Computes the font descent, in thousandths of em unit.
- double Get1000EmYMax ()

  Computes the maximum height over the baseline of the font, in thousandths of em unit.
- double Get1000EmYMin ()

  Computes the maximum depth below the baseline of the font, in thousandths of em unit.
- double Get1000EmXMax ()

Computes the maximum distance to the right of the glyph origin of the font, in thousandths of em unit.

- double Get1000EmXMin ()

  Computes the maximum distance to the left of the glyph origin of the font, in thousandths of em unit.
- Bearings Get1000EmGlyphBearings (char glyph)

  Computes the left- and right- side bearings of a glyph, in thousandths of em unit.
- VerticalMetrics Get1000EmGlyphVerticalMetrics (char glyph)

  Computes the vertical metrics of a glyph, in thousandths of em unit.
- double Get1000EmUnderlinePosition ()

  Computes the distance of the top of the underline from the baseline, in thousandths of em unit.
- double Get1000EmUnderlineThickness ()

  Computes the thickness of the underline, in thousandths of em unit.
- int GetUnitsPerEm ()

  Returns the number of units for each em in the font file. Multiplying any glyph measurement by this size should generally lead to an integer value.
- double GetItalicAngle ()

  Computes the italic angle for the current font, in thousandths of em unit. This is computed from the vertical and is negative for text that leans forwards.
- double[ ] Get1000EmUnderlineIntersections (char glyph, double position, double thickness)

  Computes the intersections between an underline at the specified position and thickness and a glyph, in thousandths of em units.
- PairKerning Get1000EmKerning (char glyph1, char glyph2)

  Gets the kerning between two glyphs.
- PairKerning Get1000EmKerning (int glyph1Index, int glyph2Index)

  Gets the kerning between two glyphs.

Static Public Member Functions

- static bool GetNames (string file, out List< TrueTypeName > names)

  Determines whether the file is a valid TrueType file and retrieves the list of names defined in it.
- static bool GetNames (Stream fs, out List< TrueTypeName > names)

  Determines whether the stream contains a valid TrueType file and retrieves the list of names defined in it.

Properties

- Stream FontStream `[get]`

  A stream pointing to the TrueType file source (either on disk or in memory). Never dispose this stream directly; if you really need to, call Destroy instead.

7.149.1 Detailed Description

Represents a font file in TrueType format. Reference: http://stevehanov.ca/blog/?id=143, https://developer.apple.com/fonts/TrueType-Reference-Manual/, https://docs.↩microsoft.com/en-us/typography/opentype/spec/

Definition at line 29 of file TrueType.cs.

7.149.2 Member Function Documentation

7.149.2.1 Destroy()

```
void VectSharp.TrueTypeFile.Destroy ( )
```

Remove this TrueType file from the cache, clear the tables and release the FontStream. Only call this when the actual file that was used to create this object needs to be changed!

Definition at line 52 of file TrueType.cs.

7.149.2.2 Get1000EmAscent()

```
double VectSharp.TrueTypeFile.Get1000EmAscent ( )
```

Computes the font ascent, in thousandths of em unit.

Returns

The font ascent in thousandths of em unit.

Definition at line 2265 of file TrueType.cs.

7.149.2.3 Get1000EmDescent()

```
double VectSharp.TrueTypeFile.Get1000EmDescent ( )
```

Computes the font descent, in thousandths of em unit.

Returns

The font descent in thousandths of em unit.

Definition at line 2275 of file TrueType.cs.

7.149.2.4 Get1000EmGlyphBearings()

```
Bearings VectSharp.TrueTypeFile.Get1000EmGlyphBearings (
            char glyph )
```

Computes the left- and right- side bearings of a glyph, in thousandths of em unit.

Parameters

glyph	The glyph whose bearings are to be computed.

Returns

The left- and right- side bearings of the glyph in thousandths of em unit

Definition at line 2357 of file TrueType.cs.

7.149.2.5 Get1000EmGlyphVerticalMetrics()

```
VerticalMetrics VectSharp.TrueTypeFile.Get1000EmGlyphVerticalMetrics (
            char glyph )
```

Computes the vertical metrics of a glyph, in thousandths of em unit.

Parameters

glyph	The glyph whose vertical metrics are to be computed.

Returns

The vertical metrics of a glyph, in thousandths of em unit.

Definition at line 2405 of file TrueType.cs.

7.149.2.6 Get1000EmGlyphWidth() [1/2]

```
double VectSharp.TrueTypeFile.Get1000EmGlyphWidth (
            char glyph )
```

Computes the advance width of a glyph, in thousandths of em unit.

Parameters

glyph	The glyph whose advance width is to be computed.

Returns

The advance width of the glyph in thousandths of em unit.

Definition at line 2216 of file TrueType.cs.

7.149.2.7 Get1000EmGlyphWidth() [2/2]

```
double VectSharp.TrueTypeFile.Get1000EmGlyphWidth (
            int glyphIndex )
```

Computes the advance width of a glyph, in thousandths of em unit.

Parameters

glyphIndex	The index of the glyph whose advance width is to be computed.

Returns

The advance width of the glyph in thousandths of em unit.

Definition at line 2234 of file TrueType.cs.

7.149.2.8 Get1000EmKerning() [1/2]

```
PairKerning VectSharp.TrueTypeFile.Get1000EmKerning (
            char glyph1,
            char glyph2 )
```

Gets the kerning between two glyphs.

Parameters

glyph1	The first glyph of the kerning pair.
glyph2	The second glyph of the kerning pair.

Returns

A PairKerning object containing information about how the position of each glyphs should be altered.

Definition at line 2634 of file TrueType.cs.

7.149.2.9 Get1000EmKerning() [2/2]

```
PairKerning VectSharp.TrueTypeFile.Get1000EmKerning (
            int glyph1Index,
            int glyph2Index )
```

Gets the kerning between two glyphs.

Parameters

glyph1Index	The index of the first glyph of the kerning pair.
glyph2Index	The index of the second glyph of the kerning pair.

Returns

A PairKerning object containing information about how the position of each glyphs should be altered.

Definition at line 2648 of file TrueType.cs.

7.149.2.10 Get1000EmUnderlineIntersections()

```
double[] VectSharp.TrueTypeFile.Get1000EmUnderlineIntersections (
            char glyph,
            double position,
            double thickness )
```

Computes the intersections between an underline at the specified position and thickness and a glyph, in thousandths of em units.

Parameters

glyph	The glyph whose intersections with the underline will be computed.
position	The distance of the top of the underline from the baseline, in thousandths of em unit.
thickness	The thickness of the underline, in thousandths of em unit.

Returns

If the underline does not intersect the glyph, this method returns `null`. Otherwise, it returns an array containing two elements, representing the horizontal coordinates of the leftmost and rightmost intersection points.

Definition at line 2484 of file TrueType.cs.

7.149.2.11 Get1000EmUnderlinePosition()

```
double VectSharp.TrueTypeFile.Get1000EmUnderlinePosition ( )
```

Computes the distance of the top of the underline from the baseline, in thousandths of em unit.

Returns

The distance of the top of the underline from the baseline, in thousandths of em unit.

Definition at line 2422 of file TrueType.cs.

7.149.2.12 Get1000EmUnderlineThickness()

```
double VectSharp.TrueTypeFile.Get1000EmUnderlineThickness ( )
```

Computes the thickness of the underline, in thousandths of em unit.

Returns

The thickness of the underline, in thousandths of em unit.

Definition at line 2438 of file TrueType.cs.

7.149.2.13 Get1000EmWinAscent()

```
double VectSharp.TrueTypeFile.Get1000EmWinAscent ( )
```

Computes the font's Win ascent, in thousandths of em unit.

Returns

The font's Win ascent in thousandths of em unit.

Definition at line 2245 of file TrueType.cs.

7.149.2.14 Get1000EmXMax()

```
double VectSharp.TrueTypeFile.Get1000EmXMax ( )
```

Computes the maximum distance to the right of the glyph origin of the font, in thousandths of em unit.

Returns

The maximum distance to the right of the glyph origin of the font in thousandths of em unit.

Definition at line 2302 of file TrueType.cs.

7.149.2.15 Get1000EmXMin()

```
double VectSharp.TrueTypeFile.Get1000EmXMin ( )
```

Computes the maximum distance to the left of the glyph origin of the font, in thousandths of em unit.

Returns

The maximum distance to the left of the glyph origin of the font in thousandths of em unit.

Definition at line 2311 of file TrueType.cs.

7.149.2.16 Get1000EmYMax()

```
double VectSharp.TrueTypeFile.Get1000EmYMax ( )
```

Computes the maximum height over the baseline of the font, in thousandths of em unit.

Returns

The maximum height over the baseline of the font in thousandths of em unit.

Definition at line 2284 of file TrueType.cs.

7.149.2.17 Get1000EmYMin()

```
double VectSharp.TrueTypeFile.Get1000EmYMin ( )
```

Computes the maximum depth below the baseline of the font, in thousandths of em unit.

Returns

The maximum depth below the baseline of the font in thousandths of em unit.

Definition at line 2293 of file TrueType.cs.

7.149.2.18 GetFirstCharIndex()

```
ushort VectSharp.TrueTypeFile.GetFirstCharIndex ( )
```

Returns the index of the first character glyph represented by the font.

Returns

The index of the first character glyph represented by the font.

Definition at line 2054 of file TrueType.cs.

7.149.2.19 GetFontFamilyName()

```
string VectSharp.TrueTypeFile.GetFontFamilyName ( )
```

Obtains the font family name from the TrueType file.

Returns

The font family name, if available; `null` otherwise.

Definition at line 1980 of file TrueType.cs.

7.149.2.20 GetFontName()

```
string VectSharp.TrueTypeFile.GetFontName ( )
```

Obtains the PostScript font name from the TrueType file.

Returns

The PostScript font name, if available; `null` otherwise.

Definition at line 2035 of file TrueType.cs.

7.149.2.21 GetFullFontFamilyName()

```
string VectSharp.TrueTypeFile.GetFullFontFamilyName ( )
```

Obtains the full font family name from the TrueType file.

Returns

The full font family name, if available; `null` otherwise.

Definition at line 2007 of file TrueType.cs.

7.149.2.22 GetGlyphIndex()

```
int VectSharp.TrueTypeFile.GetGlyphIndex (
            char glyph )
```

Determines the index of the glyph corresponding to a certain character.

Parameters

glyph	The character whose glyph is sought.

Returns

The index of the glyph in the TrueType file.

Definition at line 2144 of file TrueType.cs.

7.149.2.23 GetGlyphPath() [1/2]

```
TrueTypePoint[][] VectSharp.TrueTypeFile.GetGlyphPath (
            char glyph,
            double size )
```

Get the path that describes the shape of a glyph.

Parameters

glyph	The glyph whose path is sought.
size	The font size to be used for the font coordinates.

Returns

An array of contours, each of which is itself an array of TrueType points.

Definition at line 2206 of file TrueType.cs.

7.149.2.24 GetGlyphPath() [2/2]

```
TrueTypePoint[][] VectSharp.TrueTypeFile.GetGlyphPath (
            int glyphIndex,
            double size )
```

Get the path that describes the shape of a glyph.

Parameters

glyphIndex	The index of the glyph whose path is sought.
size	The font size to be used for the font coordinates.

Returns

An array of contours, each of which is itself an array of TrueType points.

Definition at line 2195 of file TrueType.cs.

7.149.2.25 GetItalicAngle()

```
double VectSharp.TrueTypeFile.GetItalicAngle ( )
```

Computes the italic angle for the current font, in thousandths of em unit. This is computed from the vertical and is negative for text that leans forwards.

Returns

Definition at line 2464 of file TrueType.cs.

7.149.2.26 GetLastCharIndex()

```
ushort VectSharp.TrueTypeFile.GetLastCharIndex ( )
```

Returns the index of the last character glyph represented by the font.

Returns

The index of the last character glyph represented by the font.

Definition at line 2065 of file TrueType.cs.

7.149.2.27 GetNames() [1/2]

```
static bool VectSharp.TrueTypeFile.GetNames (
            Stream fs,
            out List< TrueTypeName > names )  [static]
```

Determines whether the stream contains a valid TrueType file and retrieves the list of names defined in it.

Parameters

fs	The stream containing the TrueType file.
names	The list of names that will be returned. These will only include names with TrueType identifiers 1, 4, 6, or 16.

Returns

If the stream does not contain a valid TrueType file, `false`. If the TrueType file appears valid but does not contain a name table, `true`, but *names* will be `null`. Otherwise, `true` and *names* will not be null (but it might still be empty).

Definition at line 620 of file TrueType.cs.

7.149.2.28 GetNames() [2/2]

```
static bool VectSharp.TrueTypeFile.GetNames (
            string file,
            out List< TrueTypeName > names )  [static]
```

Determines whether the file is a valid TrueType file and retrieves the list of names defined in it.

Parameters

file	The TrueType file.
names	The list of names that will be returned. These will only include names with TrueType identifiers 1, 4, 6, or 16.

Returns

If an error occurred while opening the file, or the file does not contain a valid TrueType file, `false`. If the TrueType file appears valid but does not contain a name table, `true`, but *names* will be `null`. Otherwise, `true` and *names* will not be null (but it might still be empty).

Definition at line 596 of file TrueType.cs.

7.149.2.29 GetUnitsPerEm()

```
int VectSharp.TrueTypeFile.GetUnitsPerEm ( )
```

Returns the number of units for each em in the font file. Multiplying any glyph measurement by this size should generally lead to an integer value.

Returns

The number of units for each em in the font file.

Definition at line 2455 of file TrueType.cs.

7.149.2.30 IsBold()

```
bool VectSharp.TrueTypeFile.IsBold ( )
```

Determines whether the typeface is Bold or not.

Returns

A bool indicating whether the typeface is Bold or not

Definition at line 2099 of file TrueType.cs.

7.149.2.31 IsFixedPitch()

```
bool VectSharp.TrueTypeFile.IsFixedPitch ( )
```

Determines whether the typeface is fixed-pitch (aka monospaces) or not.

Returns

A bool indicating whether the typeface is fixed-pitch (aka monospaces) or not.

Definition at line 2110 of file TrueType.cs.

7.149.2.32 IsItalic()

```
bool VectSharp.TrueTypeFile.IsItalic ( )
```

Determines whether the typeface is Italic or Oblique or not.

Returns

A bool indicating whether the typeface is Italic or Oblique or not.

Definition at line 2077 of file TrueType.cs.

7.149.2.33 IsOblique()

```
bool VectSharp.TrueTypeFile.IsOblique ( )
```

Determines whether the typeface is Oblique or not.

Returns

A bool indicating whether the typeface is Oblique or not.

Definition at line 2088 of file TrueType.cs.

7.149.2.34 IsScript()

```
bool VectSharp.TrueTypeFile.IsScript ( )
```

Determines whether the typeface is a script typeface or not.

Returns

A bool indicating whether the typeface is a script typeface or not.

Definition at line 2132 of file TrueType.cs.

7.149.2.35 IsSerif()

```
bool VectSharp.TrueTypeFile.IsSerif ( )
```

Determines whether the typeface is serifed or not.

Returns

A bool indicating whether the typeface is serifed or not.

Definition at line 2121 of file TrueType.cs.

7.149.2.36 SubsetFont()

```
TrueTypeFile VectSharp.TrueTypeFile.SubsetFont (
            string charactersToInclude,
            bool consolidateAt32 = false,
            Dictionary< char, char > outputEncoding = null )
```

Create a subset of the TrueType file, containing only the glyphs for the specified characters.

Parameters

charactersToInclude	A string containing the characters for which the glyphs should be included.
consolidateAt32	If true, the character map is rearranged so that the included glyphs start at the unicode U+0032 control point.
outputEncoding	If *consolidateAt32* is true, entries will be added to this dictionary mapping the original characters to the new map (that starts at U+0033).

Returns

Definition at line 696 of file TrueType.cs.

7.149.3 Property Documentation

7.149.3.1 FontStream

```
Stream VectSharp.TrueTypeFile.FontStream  [get]
```

A stream pointing to the TrueType file source (either on disk or in memory). Never dispose this stream directly; if you really need to, call Destroy instead.

Definition at line 46 of file TrueType.cs.

The documentation for this class was generated from the following file:

- VectSharp/TrueType.cs

7.150 VectSharp.TrueTypeFile.TrueTypeName Struct Reference

Represets a TrueType name.

Public Types

- enum NameIdentifier

  Describes a kind of TrueType name.

Public Attributes

- NameIdentifier NameId

  The kind of name represented by this struct.
- string Name

  The name represented by this struct.

7.150.1 Detailed Description

Represets a TrueType name.

Definition at line 543 of file TrueType.cs.

7.150.2 Member Enumeration Documentation

7.150.2.1 NameIdentifier

`enum VectSharp.TrueTypeFile.TrueTypeName.NameIdentifier`

Describes a kind of TrueType name.

Definition at line 548 of file TrueType.cs.

7.150.3 Member Data Documentation

7.150.3.1 Name

`string VectSharp.TrueTypeFile.TrueTypeName.Name`

The name represented by this struct.

Definition at line 579 of file TrueType.cs.

7.150.3.2 NameId

`NameIdentifier VectSharp.TrueTypeFile.TrueTypeName.NameId`

The kind of name represented by this struct.

Definition at line 574 of file TrueType.cs.

The documentation for this struct was generated from the following file:

- VectSharp/TrueType.cs

7.151 VectSharp.TrueTypeFile.TrueTypePoint Struct Reference

Represents a point in a TrueType path description.

Public Attributes

- double X

  The horizontal coordinate of the point.
- double Y

  The vertical coordinate of the point.
- bool IsOnCurve

  Whether the point is a point on the curve, or a control point of a quadratic Bezier curve.

7.151.1 Detailed Description

Represents a point in a TrueType path description.

Definition at line 1494 of file TrueType.cs.

7.151.2 Member Data Documentation

7.151.2.1 IsOnCurve

```
bool VectSharp.TrueTypeFile.TrueTypePoint.IsOnCurve
```

Whether the point is a point on the curve, or a control point of a quadratic Bezier curve.

Definition at line 1509 of file TrueType.cs.

7.151.2.2 X

```
double VectSharp.TrueTypeFile.TrueTypePoint.X
```

The horizontal coordinate of the point.

Definition at line 1499 of file TrueType.cs.

7.151.2.3 Y

```
double VectSharp.TrueTypeFile.TrueTypePoint.Y
```

The vertical coordinate of the point.

Definition at line 1504 of file TrueType.cs.

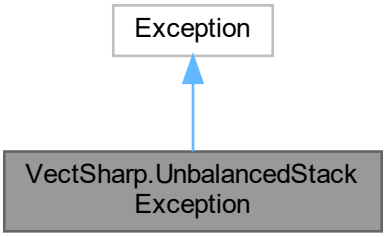
The documentation for this struct was generated from the following file:

- VectSharp/TrueType.cs

7.152 VectSharp.UnbalancedStackException Class Reference

The exception that is thrown when an unbalanced graphics state stack occurs.

Inheritance diagram for VectSharp.UnbalancedStackException:



7.152.1 Detailed Description

The exception that is thrown when an unbalanced graphics state stack occurs.

Definition at line 254 of file Graphics.cs.

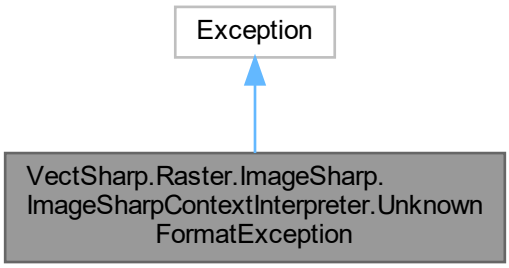
The documentation for this class was generated from the following file:

- VectSharp/Graphics.cs

7.153 VectSharp.Raster.ImageSharp.ImageSharpContextInterpreter.↩ UnknownFormatException Class Reference

The exception that is raised when the output file format is not specified and the file name does not have an extension corresponding to a known file format.

Inheritance diagram for VectSharp.Raster.ImageSharp.ImageSharpContextInterpreter.UnknownFormatException:



Properties

- string Format [get]

  The extension of the file that does not correspond to any known file format.

7.153.1 Detailed Description

The exception that is raised when the output file format is not specified and the file name does not have an extension corresponding to a known file format.

Definition at line 1113 of file ImageSharpContext.cs.

7.153.2 Property Documentation

7.153.2.1 Format

```
string VectSharp.Raster.ImageSharp.ImageSharpContextInterpreter.UnknownFormatException.Format
[get]
```

The extension of the file that does not correspond to any known file format.

Definition at line 1118 of file ImageSharpContext.cs.

The documentation for this class was generated from the following file:

- VectSharp.Raster.ImageSharp/ImageSharpContext.cs

7.154 VectSharp.TrueTypeFile.VerticalMetrics Struct Reference

Represents the maximum heigth above and depth below the baseline of a glyph.

Public Attributes

- int YMin

  The maximum depth below the baseline of the glyph.
- int YMax

  The maximum height above the baseline of the glyph.

7.154.1 Detailed Description

Represents the maximum heigth above and depth below the baseline of a glyph.

Definition at line 2374 of file TrueType.cs.

7.154.2 Member Data Documentation

7.154.2.1 YMax

```
int VectSharp.TrueTypeFile.VerticalMetrics.YMax
```

The maximum height above the baseline of the glyph.

Definition at line 2384 of file TrueType.cs.

7.154.2.2 YMin

```
int VectSharp.TrueTypeFile.VerticalMetrics.YMin
```

The maximum depth below the baseline of the glyph.

Definition at line 2379 of file TrueType.cs.

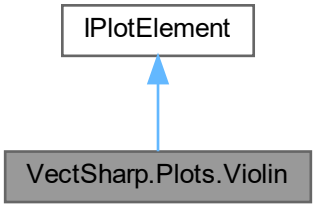
The documentation for this struct was generated from the following file:

- VectSharp/TrueType.cs

7.155 VectSharp.Plots.Violin Class Reference

A plot element that draws a violin plot.

Inheritance diagram for VectSharp.Plots.Violin:



Public Types

- enum ViolinSide

  The sides on which a violin can be drawn.

Public Member Functions

- Violin (IReadOnlyList< double > position, IReadOnlyList< double > direction, IReadOnlyList< double > data, ICoordinateSystem< IReadOnlyList< double > > coordinateSystem)

  Create a new Violin instance.
- void Plot (Graphics target)

  Draw the plot element on the specified target Graphics.

Parameters

target	*The Graphics on which to draw.*

Properties

- IReadOnlyList< double > Position `[get, set]`

  The position of the origin of the violin (e.g., the 0 in data space coordinates).
- IReadOnlyList< double > Direction `[get, set]`

  The direction along which the violin is drawn, in data space coordinates.
- double Width = 10 `[get, set]`

  The width of the violin in data space coordinates.
- bool Smooth = true `[get, set]`

  Determines whether the violin is smoothed or not.
- ViolinSide Sides = ViolinSide.Both `[get, set]`

  Determines on which side(s) the violin is drawn.
- IReadOnlyList< double > Data `[get, set]`

  The values whose distribution is displayed by the violin plot.
- int MaxBins = int.MaxValue `[get, set]`

  Maximum number of bins.
- PlotElementPresentationAttributes PresentationAttributes = new PlotElementPresentationAttributes() { Fill = Colours.White } `[get, set]`

  Presentation attributes for the violin plot.
- ICoordinateSystem< IReadOnlyList< double > > CoordinateSystem `[get, set]`

  The coordinate system used to transform the points from data space to plot space.
- string Tag `[get, set]`

  A tag to identify the violin in the plot.

7.155.1 Detailed Description

A plot element that draws a violin plot.

Definition at line 27 of file Violin.cs.

7.155.2 Member Enumeration Documentation

7.155.2.1 ViolinSide

`enum VectSharp.Plots.Violin.ViolinSide`

The sides on which a violin can be drawn.

Definition at line 32 of file Violin.cs.

7.155.3 Constructor & Destructor Documentation

7.155.3.1 Violin()

```
VectSharp.Plots.Violin.Violin (
            IReadOnlyList< double > position,
            IReadOnlyList< double > direction,
            IReadOnlyList< double > data,
            ICoordinateSystem< IReadOnlyList< double > > coordinateSystem )
```

Create a new Violin instance.

Parameters

position	The position of the origin of the violin (e.g., the 0 in data space coordinates).
direction	The direction along which the violin is drawn, in data space coordinates.
data	The values whose distribution is displayed by the violin plot.
coordinateSystem	The coordinate system used to transform the points from data space to plot space.

Definition at line 108 of file Violin.cs.

7.155.4 Member Function Documentation

7.155.4.1 Plot()

```
void VectSharp.Plots.Violin.Plot (
            Graphics target )
```

Draw the plot element on the specified *target* Graphics.

Parameters

target	The Graphics on which to draw.

Implements VectSharp.Plots.IPlotElement.

Definition at line 117 of file Violin.cs.

7.155.5 Property Documentation

7.155.5.1 CoordinateSystem

```
ICoordinateSystem<IReadOnlyList<double> > VectSharp.Plots.Violin.CoordinateSystem  [get],
[set]
```

The coordinate system used to transform the points from data space to plot space.

Implements VectSharp.Plots.IPlotElement.

Definition at line 93 of file Violin.cs.

7.155.5.2 Data

```
IReadOnlyList<double> VectSharp.Plots.Violin.Data  [get], [set]
```

The values whose distribution is displayed by the violin plot.

Definition at line 78 of file Violin.cs.

7.155.5.3 Direction

```
IReadOnlyList<double> VectSharp.Plots.Violin.Direction  [get], [set]
```

The direction along which the violin is drawn, in data space coordinates.

Definition at line 58 of file Violin.cs.

7.155.5.4 MaxBins

```
int VectSharp.Plots.Violin.MaxBins = int.MaxValue  [get], [set]
```

Maximum number of bins.

Definition at line 83 of file Violin.cs.

7.155.5.5 Position

```
IReadOnlyList<double> VectSharp.Plots.Violin.Position  [get], [set]
```

The position of the origin of the violin (e.g., the 0 in data space coordinates).

Definition at line 53 of file Violin.cs.

7.155.5.6 PresentationAttributes

```
PlotElementPresentationAttributes VectSharp.Plots.Violin.PresentationAttributes = new PlotElementPresentationA
{ Fill = Colours.White }  [get], [set]
```

Presentation attributes for the violin plot.

Definition at line 88 of file Violin.cs.

7.155.5.7 Sides

```
ViolinSide VectSharp.Plots.Violin.Sides = ViolinSide.Both  [get], [set]
```

Determines on which side(s) the violin is drawn.

Definition at line 73 of file Violin.cs.

7.155.5.8 Smooth

```
bool VectSharp.Plots.Violin.Smooth = true  [get], [set]
```

Determines whether the violin is smoothed or not.

Definition at line 68 of file Violin.cs.

7.155.5.9 Tag

```
string VectSharp.Plots.Violin.Tag  [get], [set]
```

A tag to identify the violin in the plot.

Definition at line 99 of file Violin.cs.

7.155.5.10 Width

```
double VectSharp.Plots.Violin.Width = 10  [get], [set]
```

The width of the violin in data space coordinates.

Definition at line 63 of file Violin.cs.
